- Samples collected 3x a day
- Analyzed for all major nutrients and suspended sediments

Sandusky River
Start out with
concentration
data...
mg/L

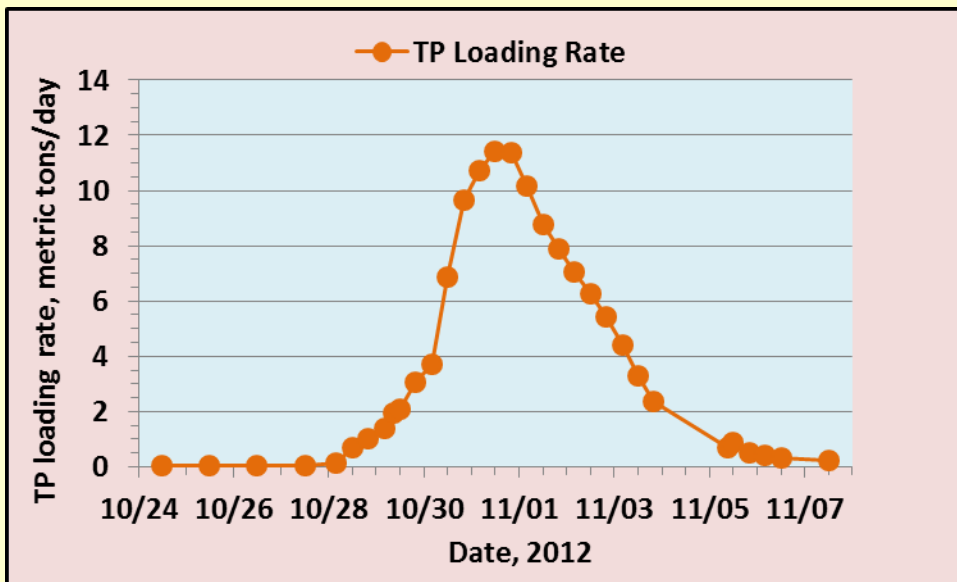

Add river flow
rate data from
U.S. Geological
Survey...
cubic feet/second

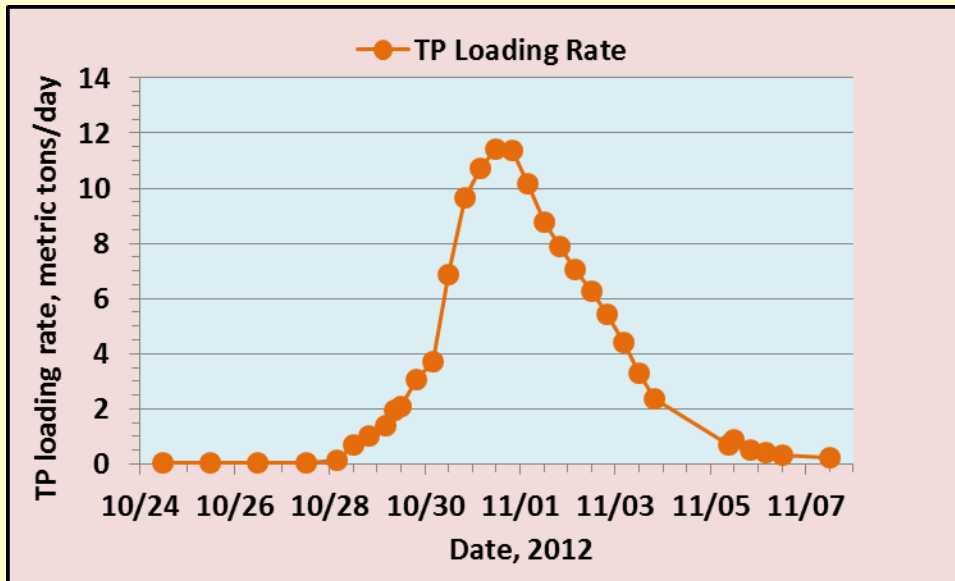

Calculate the
loading rate...
Amount/time

$\text{amount/unit time} = \text{amount/unit volume} \times \text{volume/unit time}$

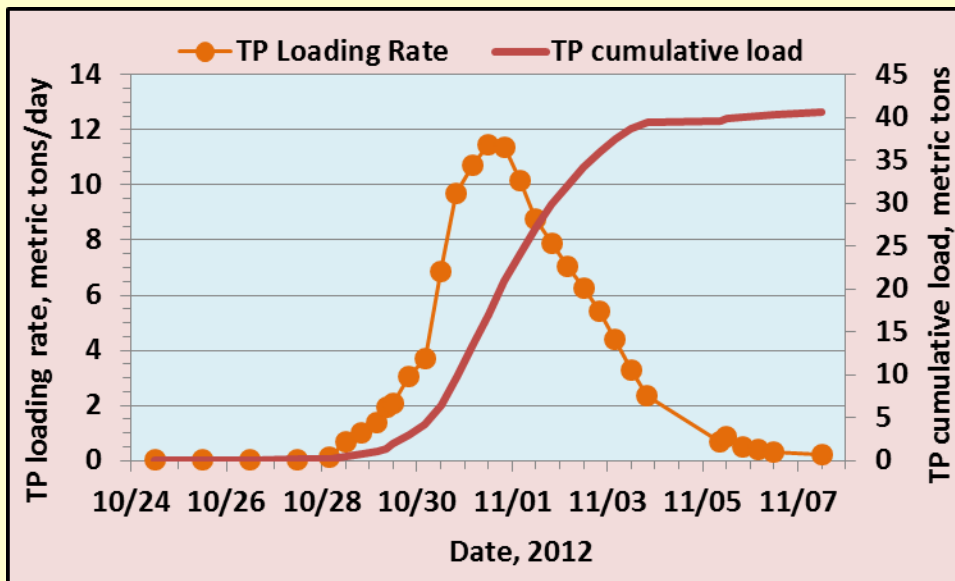

Here is the TP
loading rate in
units of metric
tons per day

Calculate TP
load over a
particular time
period

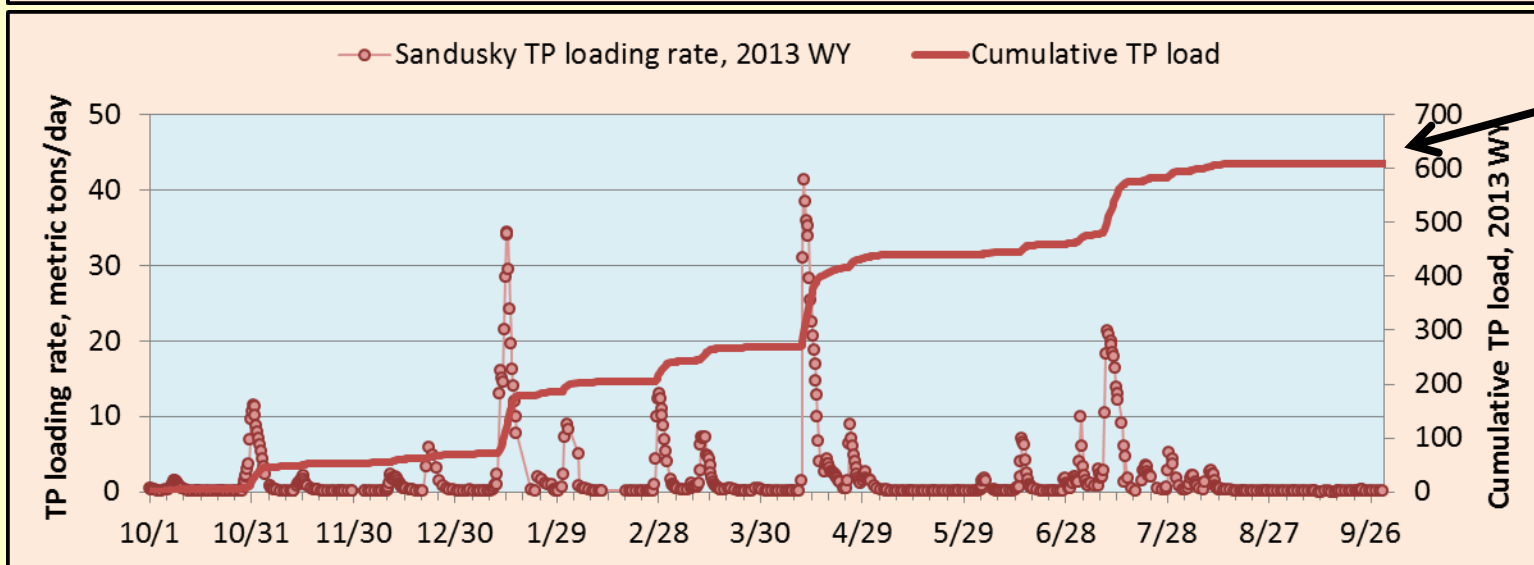

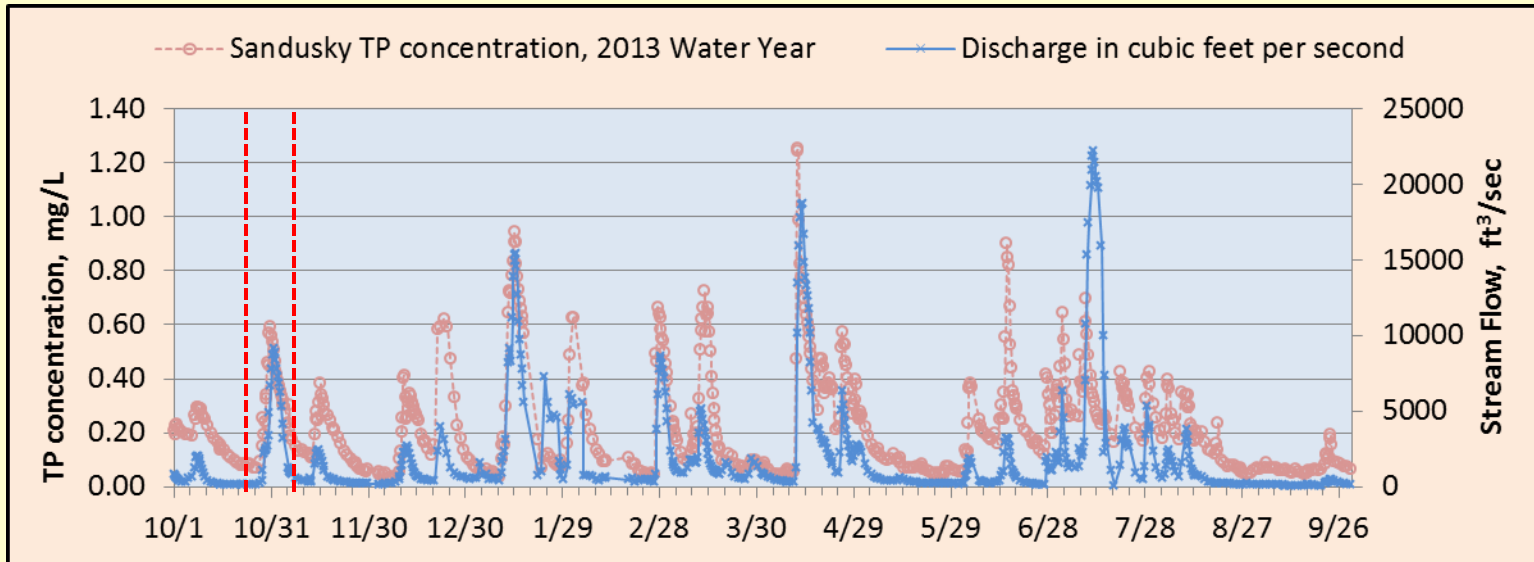

Metric tons/day x days = metric tons

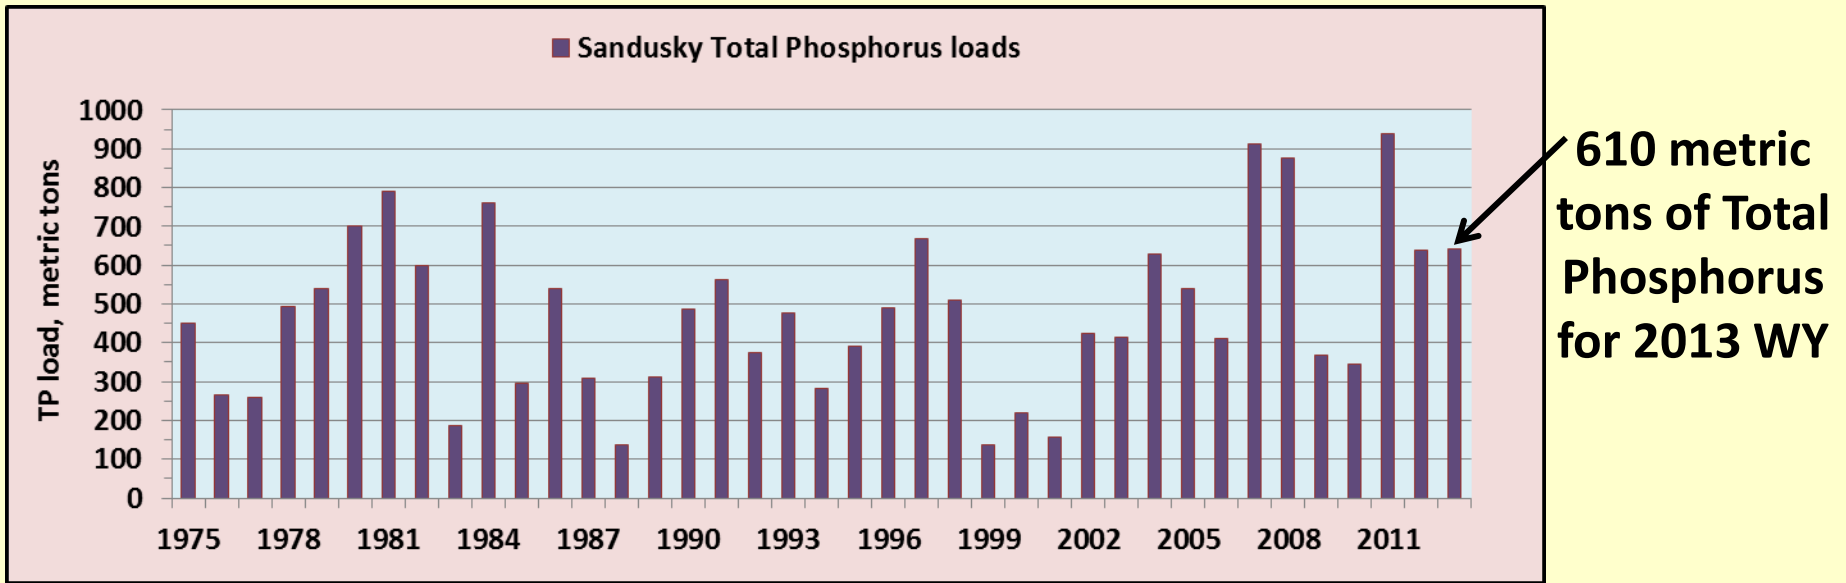

Add in each
successive day
to obtain
cumulative
loads for time
period

Apply the above procedures to data for an entire year (Here the 2013 Water Year)

**610 metric
tons of Total
Phosphorus**

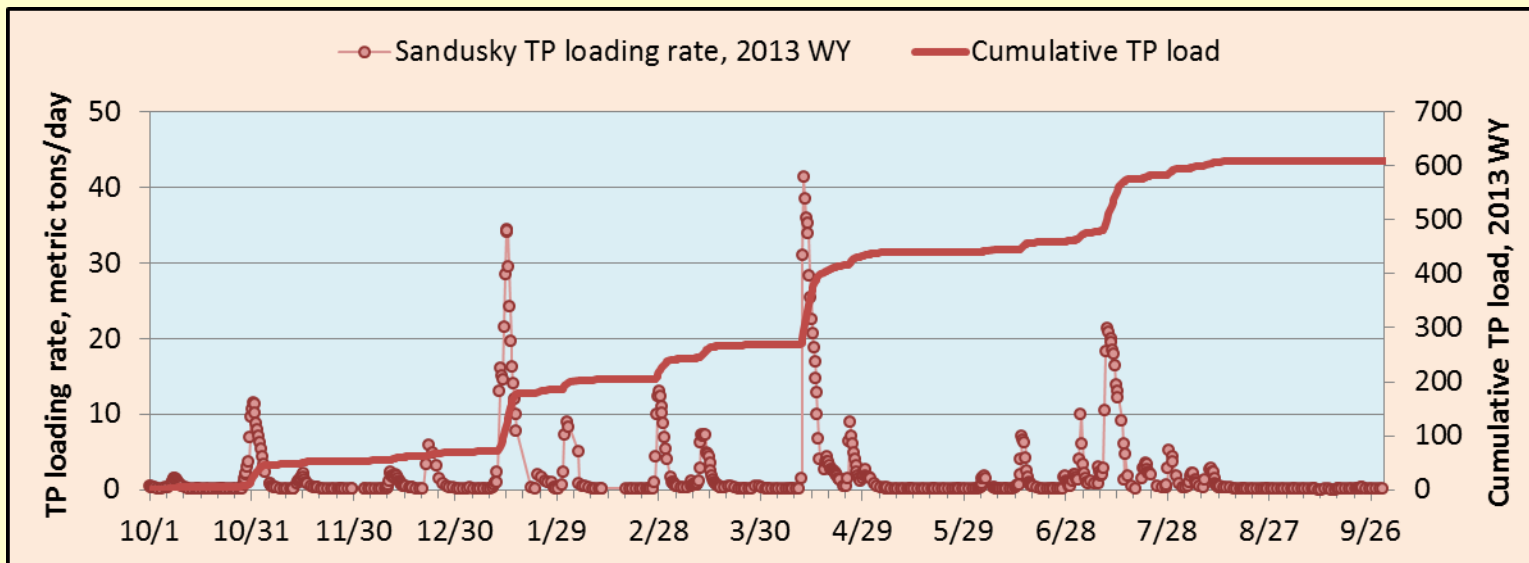

The Sandusky Fremont data set through the 2014 Water Year

- 40 Water Years (1975-2014)
- 18,625 samples analyzed

The Honey Creek data set through the 2014 Water Year

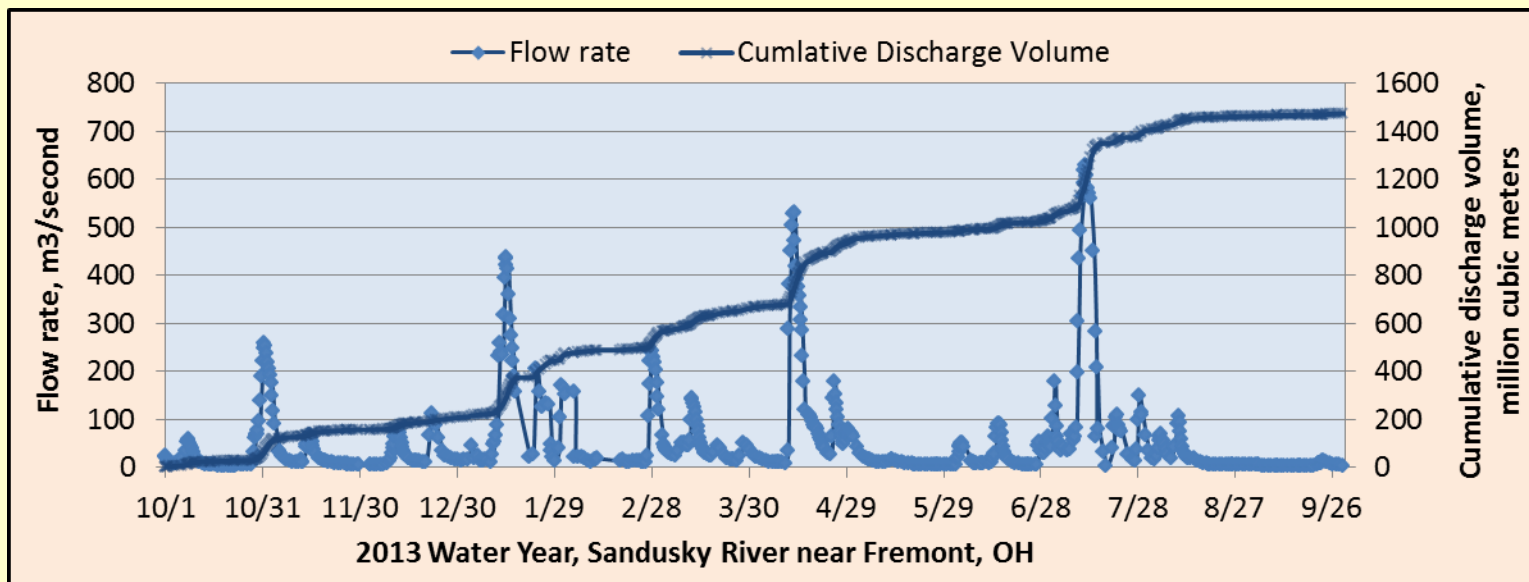

- 39 Water Years (1975-2014)
- 19,878 samples analyzed

These are the largest data sets of their type in the United States, and probably globally.

TP load-

**610.1
metric
tons**

**Volume
discharged**

**1,473.9
million cubic
meters**

Annual Flow Weighted Mean Concentration (FWMC) of Total Phosphorus

610.1 metric tons/1,473.9 million cubic meters = 0.414 mg/L

Relationship of FWMCs, discharge volumes, and loads

tons**

Which variable can farmer's impact the most?

- **FWMCs?**
- **Annual Discharge?**

Sandusky River, Total Phosphorus concentrations, 2013 Water Year

What is the average concentration of TP at the monitoring station?

1. Add up all the samples and divide by the number of samples?

$$155.75/604 = \underline{0.258 \text{ mg/L}}$$

2. Flow weighted mean concentration = load /volume

$$610.1 \text{ metric tons}/1,473.9 \cdot 10^6 \text{ m}^3 = \underline{0.414 \text{ mg/L}}$$

3. Time weighted mean concentration (TWMC)

$$\text{Sum}(t_i \cdot c_i) / \text{Sum}(t_i) = \underline{0.203 \text{ mg/L}} \quad (t = \text{time window for each sample})$$

**From here in
the 1960s &
1970s...**

With some very good years in between!

**Re-eutrophication
of Lake Erie**

**... to here
in the
2000s**

A blue-green algal bloom in the vicinity of the Toledo public water supply intake in 2014 resulted in a 2-day closure of the drinking water supply.

This has triggered a legislative response --- Senate Bill 1

From here in
the 1960s &
1970s...

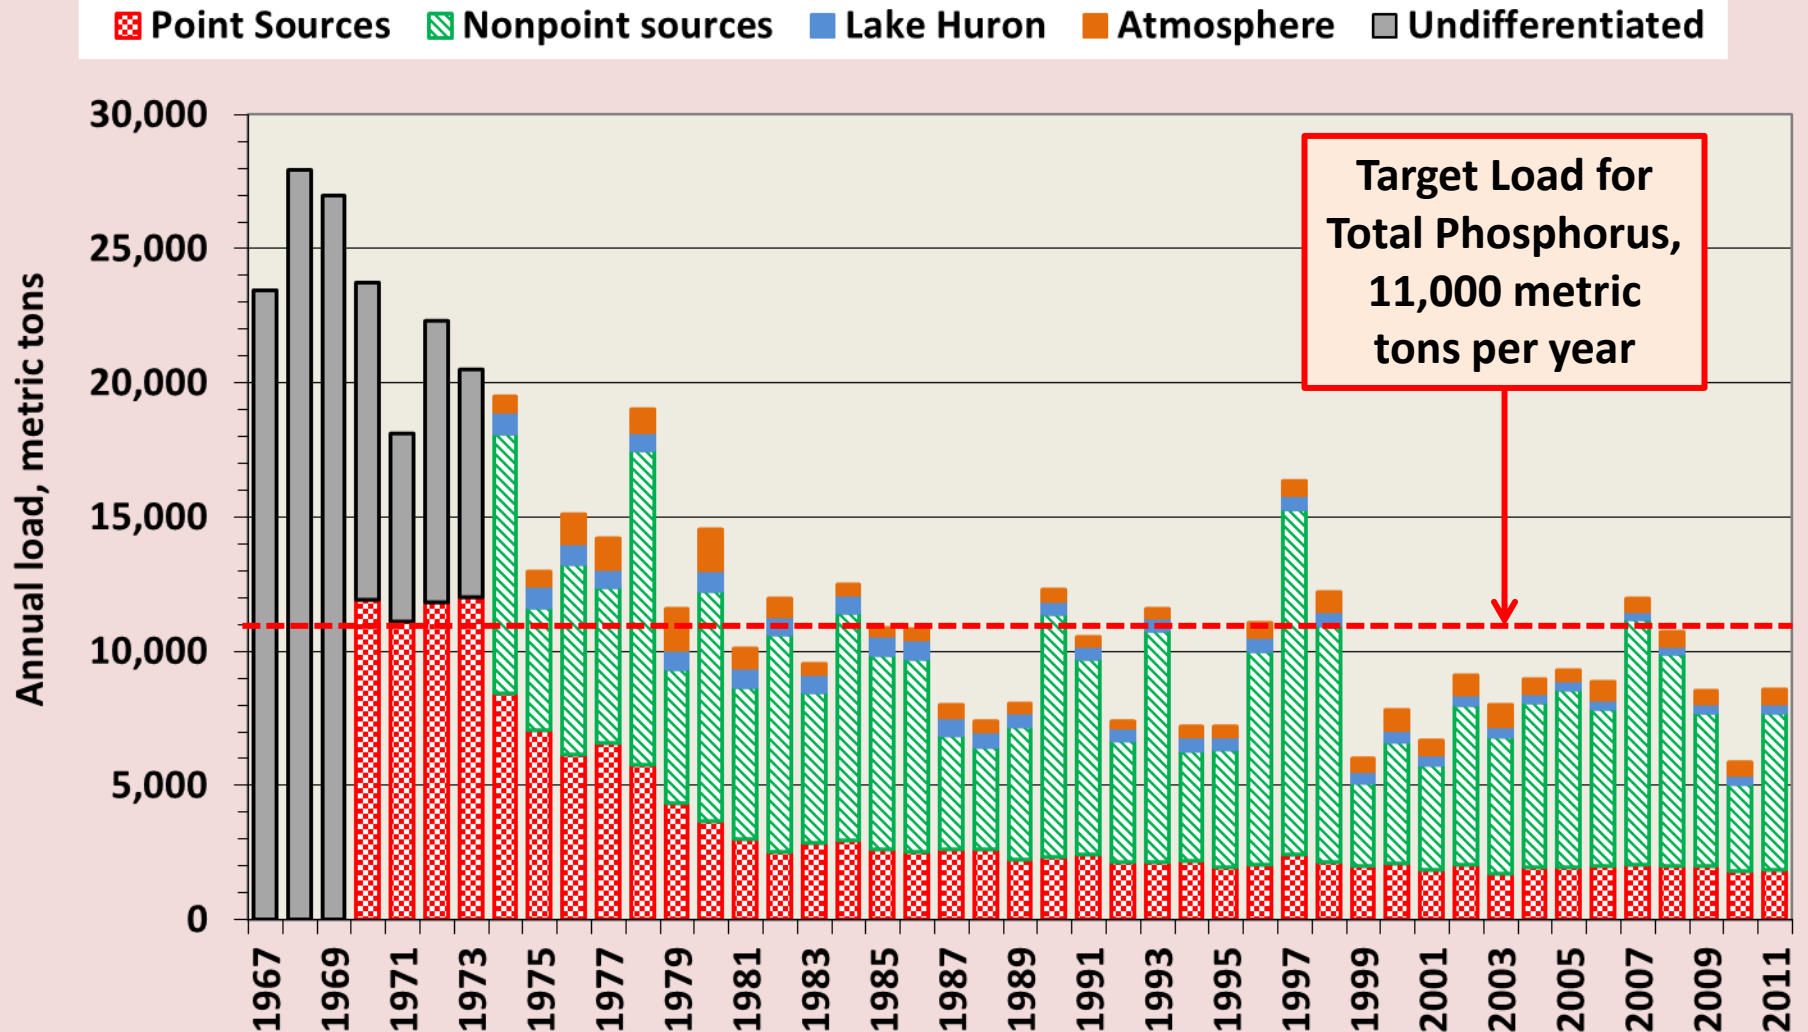

With some very good years in between!

Why?

... to here
in the
2000s

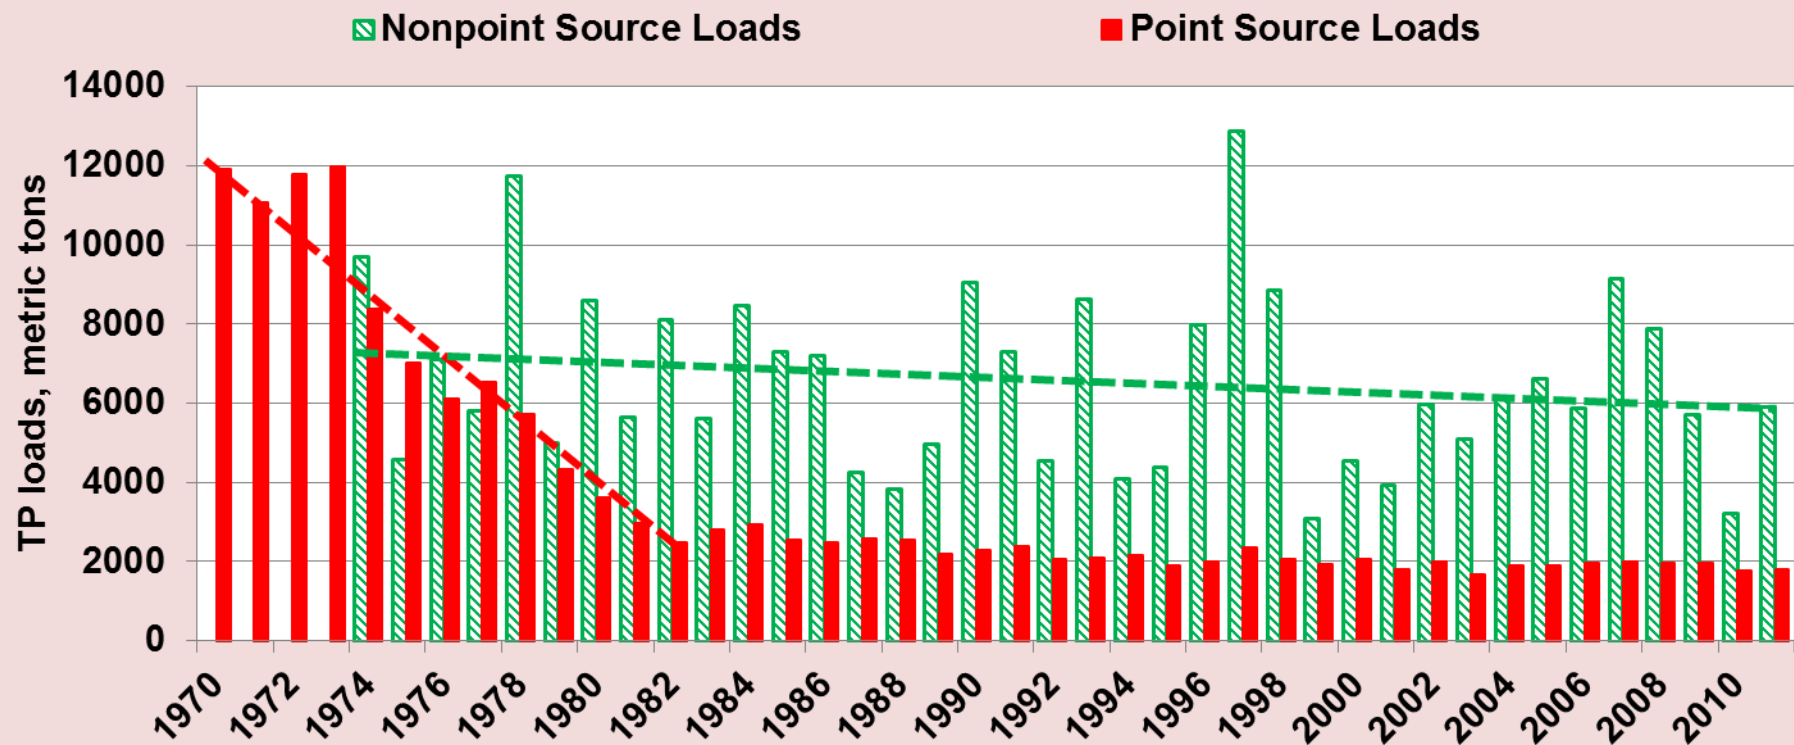

Lake Erie Total Phosphorus Loads from External Sources

Target load was first met in 1981.

Now target is only exceeded in wet years with large nonpoint loads

No obvious explanation for re-eutrophication of the Lake based on total phosphorus loads.

Reductions in point source loading through P-removal programs at municipal (and industrial) waste treatment plants and from bans of phosphorus in laundry detergents.

A focus on nonpoint phosphorus control was called for in the 1983 supplement to the Great Lakes Water Quality Agreement of 1978. It called for a 2000 metric ton reductions (1,700 MTA from the US and 300 MTA from Canada.

**Maumee River TP Composition,
1982-1987**

**Sandusky River, TP composition,
1982-1987**

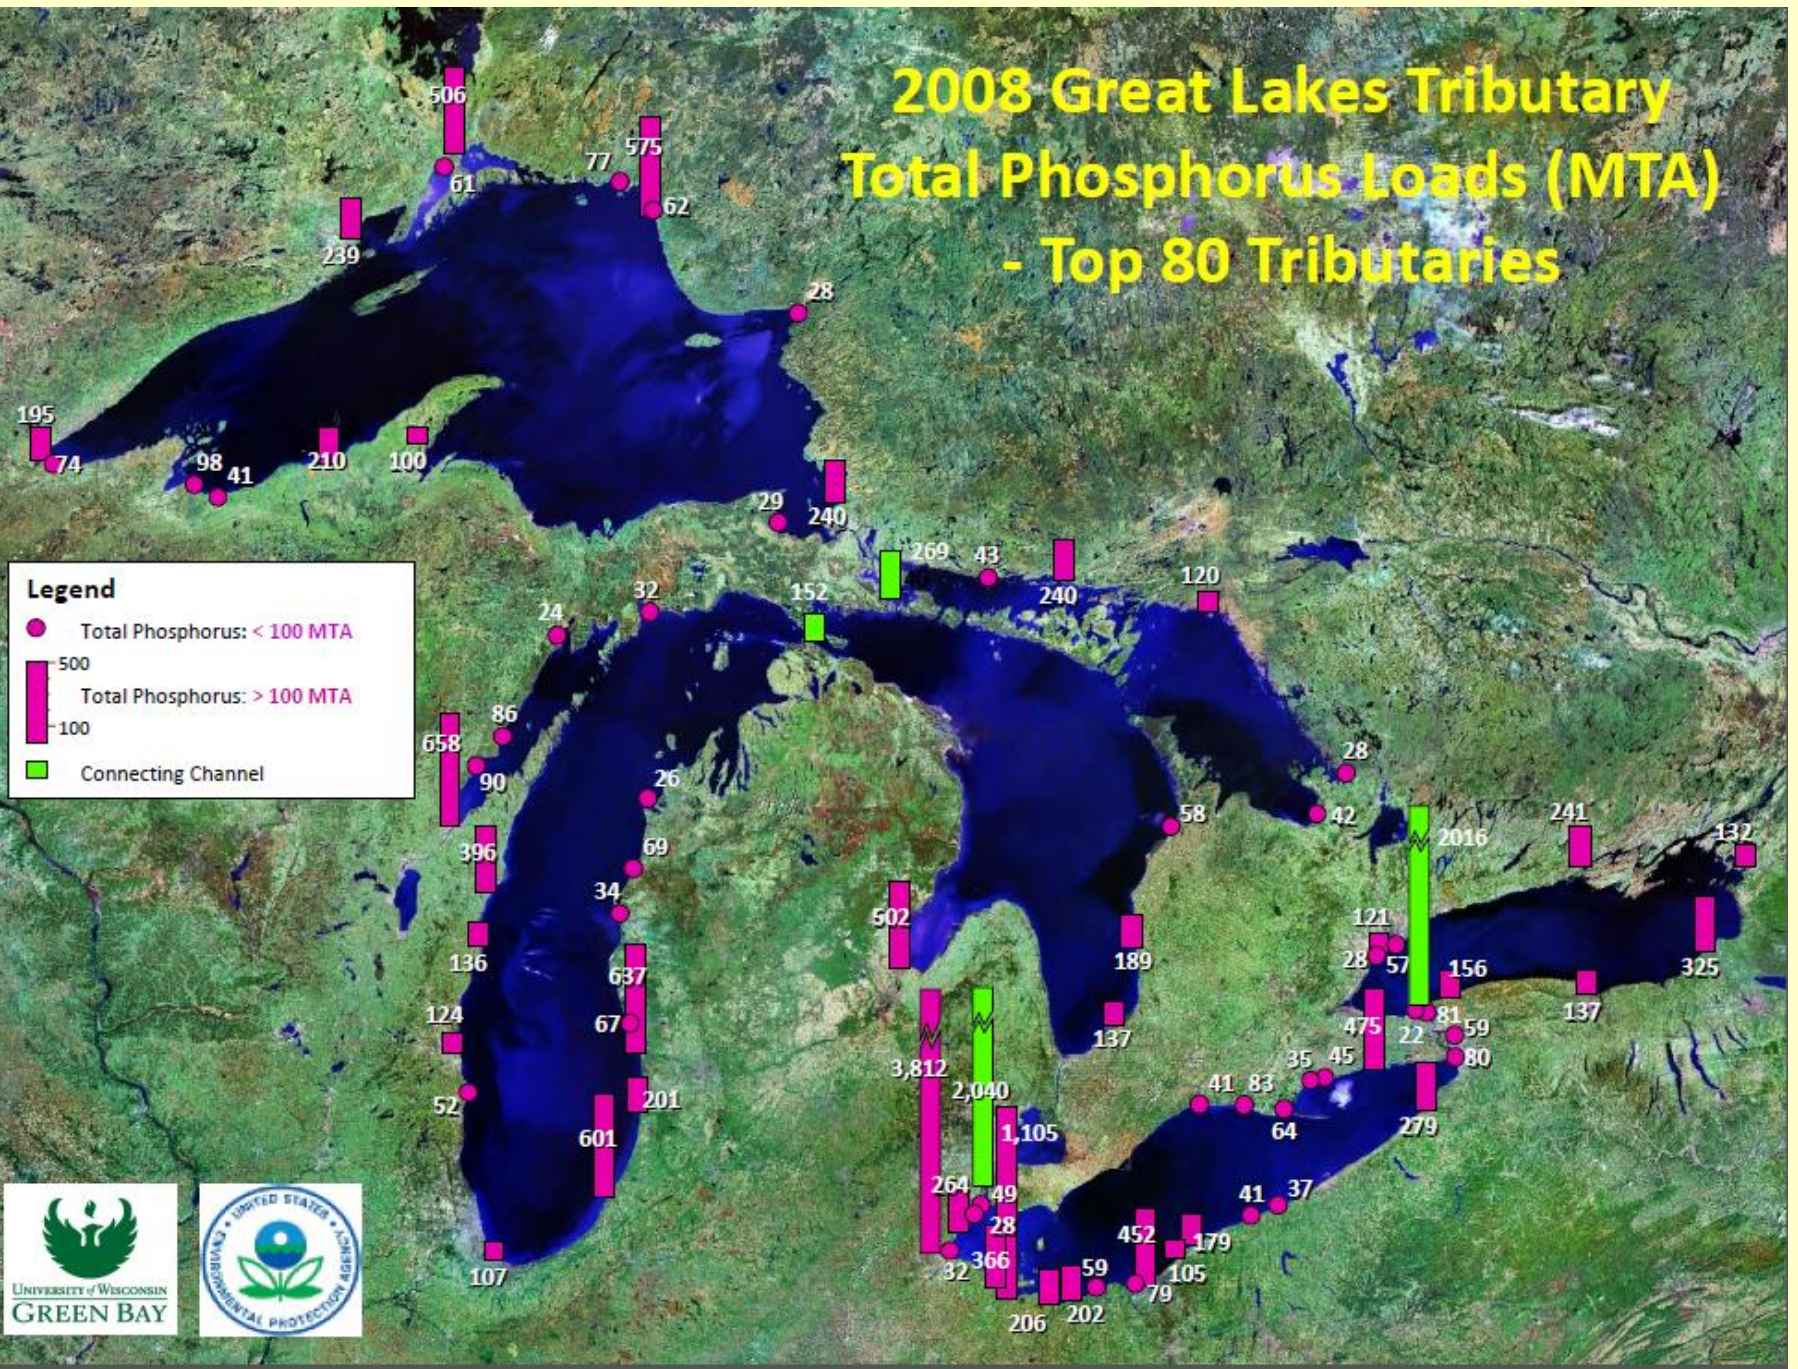

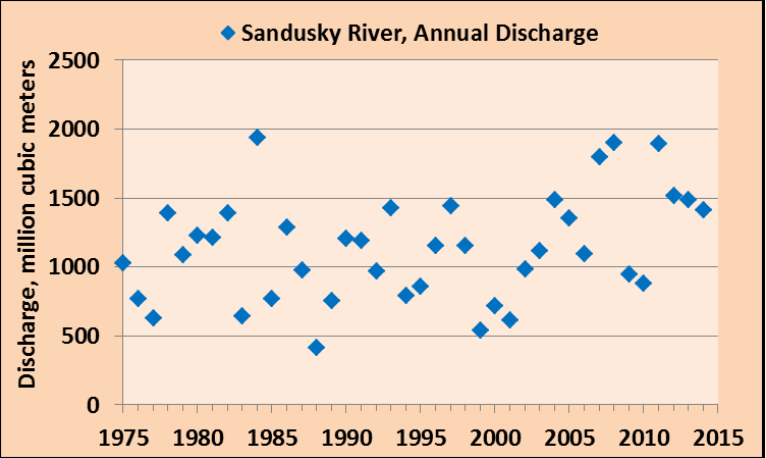

In the 1980s, total phosphorus loading was dominated by particulate phosphorus.

Particulate phosphorus loading was associated with cropland erosion of suspended sediments.

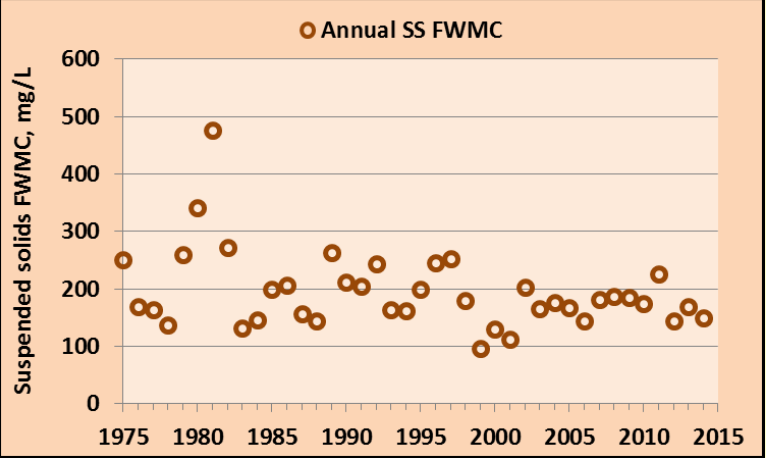

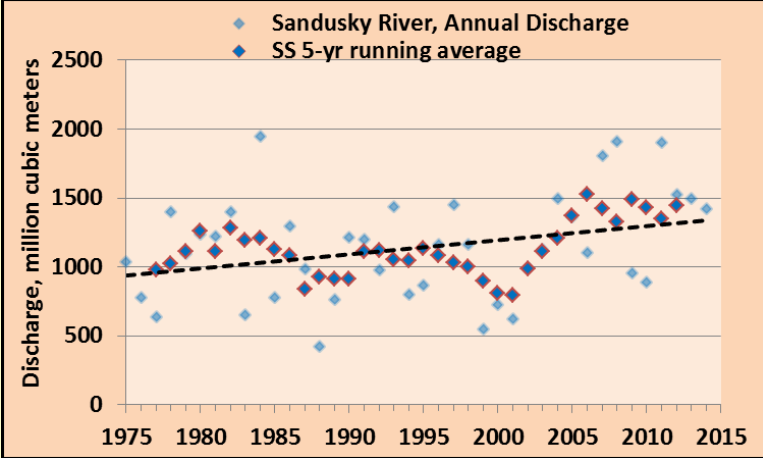

No-till and reduced till agriculture were effective in reducing erosion.

BAP**

**Large decrease
in DRP load
followed by even
larger increase**

Trends in PBAP and DRP loads for three Ag watersheds

All three of our long-term agricultural watersheds have shown similar patterns in particulate bioavailable P loading and DRP loading:

- Particulate BAP loads have fluctuated with discharge patterns and shown a small overall increase through 2014.
- DRP loads decreased substantially from the mid-1970s to the mid-1990s, then increased by large amounts through the mid-2000s followed by a leveling off to the 2014.
- In terms of bioavailable P loading, DRP now exceeds PBAP in all three rivers.

Why the emphasis on dissolved reactive phosphorus (DRP)?

(It's a small part of the total phosphorus load)

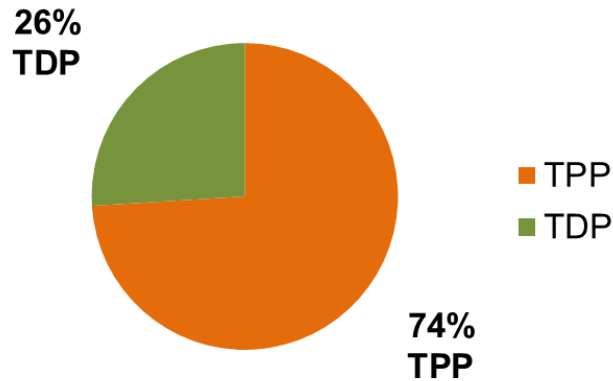

1. Bioavailability

2. Delivery

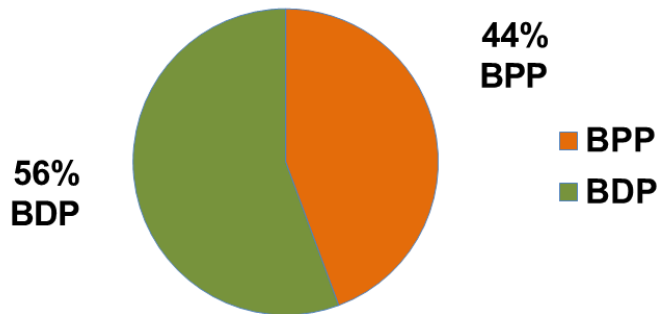

**Maumee River at Waterville,
Average Annual Loads,
2003-2012 WYs**

**Total Phosphorus at Waterville
2,437 metric tons/year**

Total Phosphorus

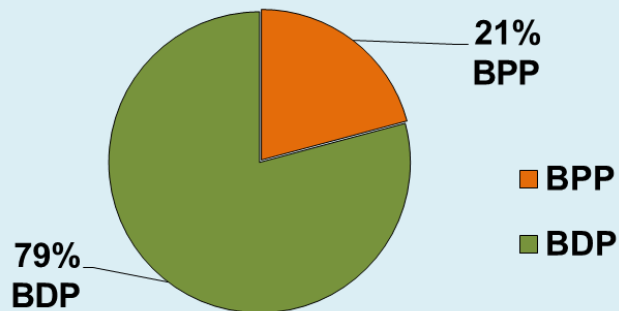

Total Bioavailable Phosphorus

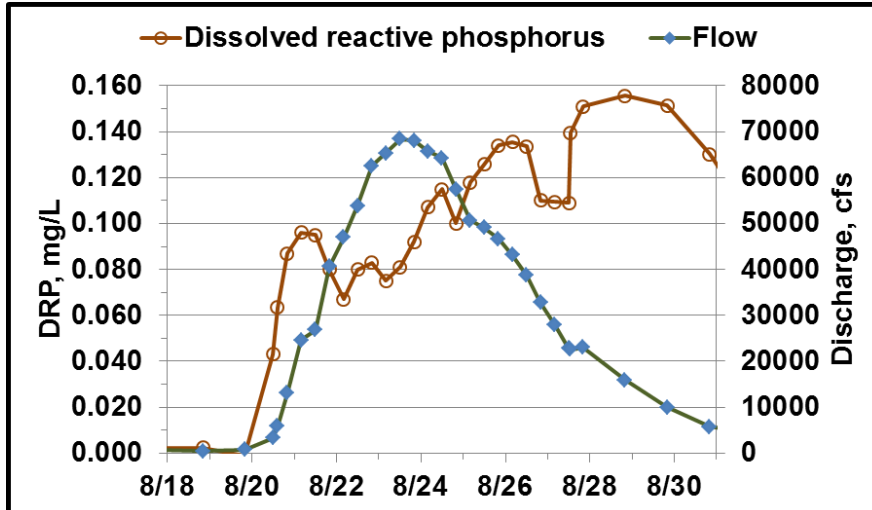

**Chemically Bioavailable Phosphorus
at Waterville
1,098 metric tons/year
(45% of TP load at Waterville)**

Delivered Bioavailable P

**Delivered Bioavailable Phosphorus
772 metric tons/year
(32% of TP load at Waterville)**

**Assumes 33% delivery of TPP
between tributary monitoring
station and Western Basin**

Water Column

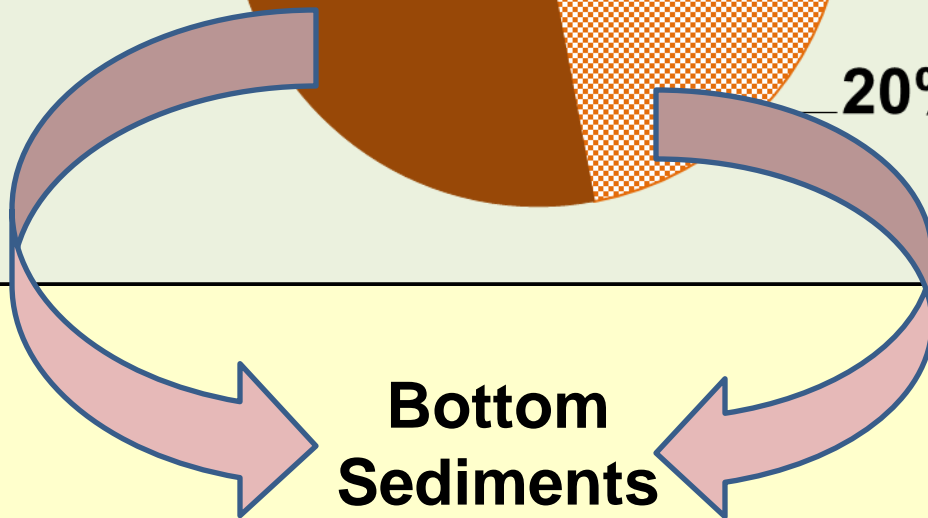

Algal Growth

Internal phosphorus loading

Bottom Sediments

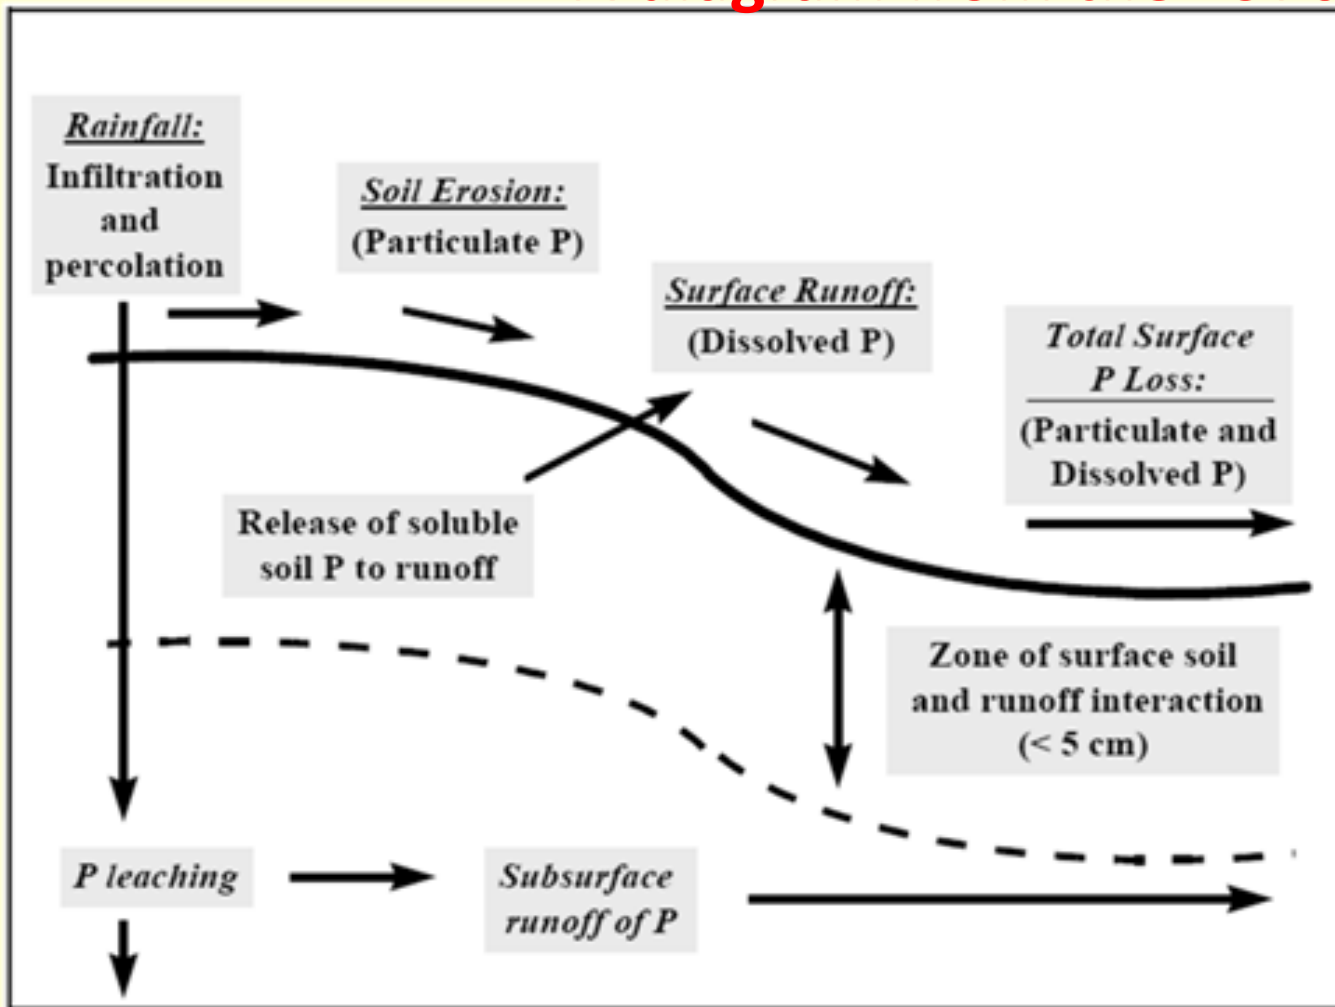

Why did the concentrations of dissolved phosphorus in storm water from agricultural watersheds increase?

- **Increased broadcasting of fertilizers**
- **Phosphorus stratification in cropland soils**
- **Increased tile drainage**
- **Increasing phosphorus soil test levels**

A quick look at stratification and direct runoff of broadcast fertilizers....

How does phosphorus move from cropland to streams, rivers and lakes?

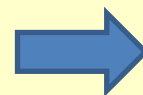

A diagram from the 1970s ...

pollution

Have views of phosphorus pathways to water changed?

Macropores

From Kleinman et al. 2011

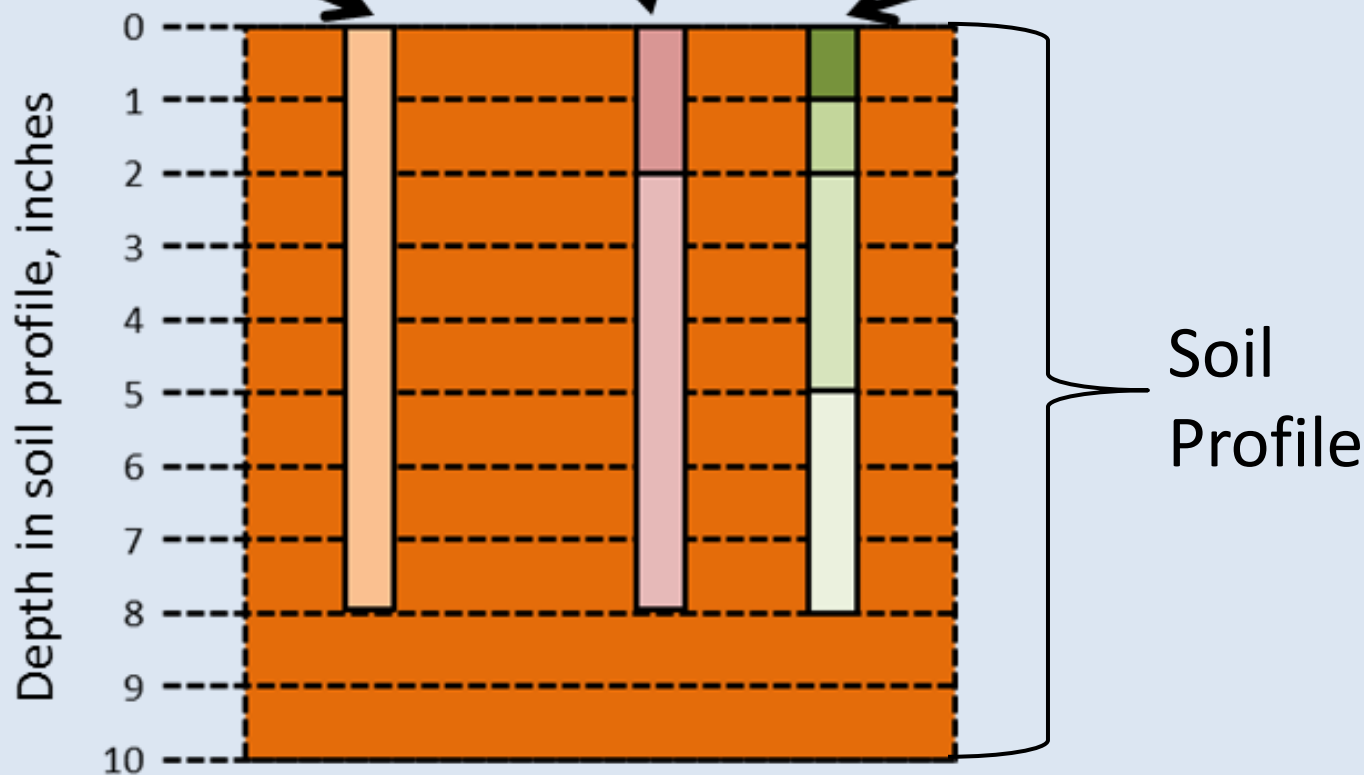

Dissolved P in runoff can increase under no-till management

Sandusky Watershed Stratified Soil Testing Program, supported by GLPF

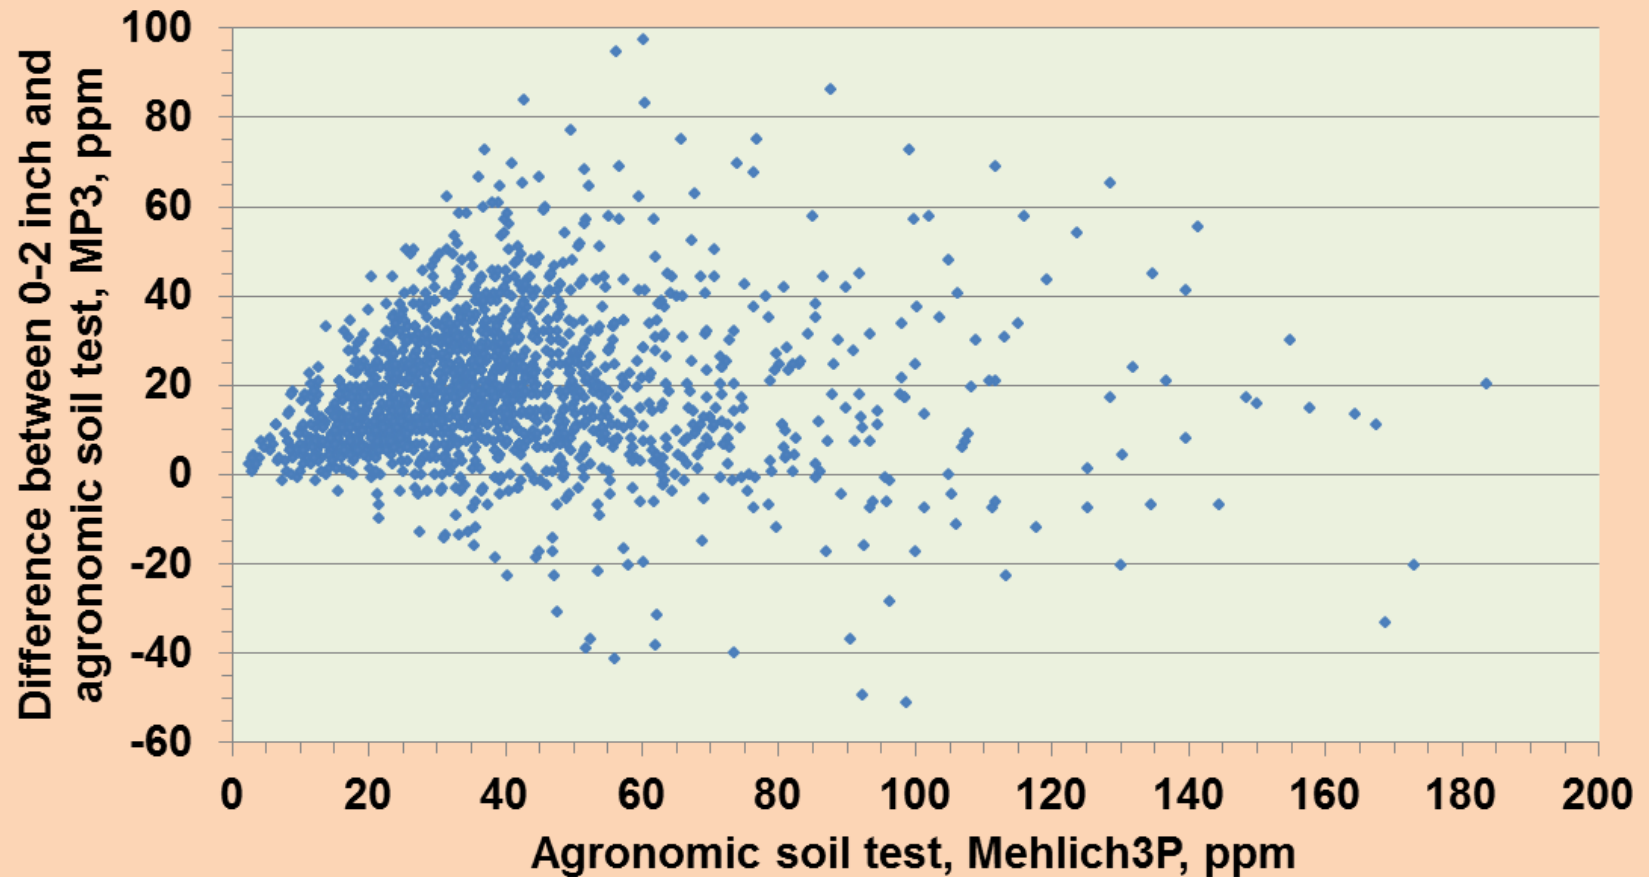

Agronomic soil testing:
Composite of 0-8 inch
cores.

Environmental soil testing #1:
Composites of 0-2 and 2-8
inch portions of cores.

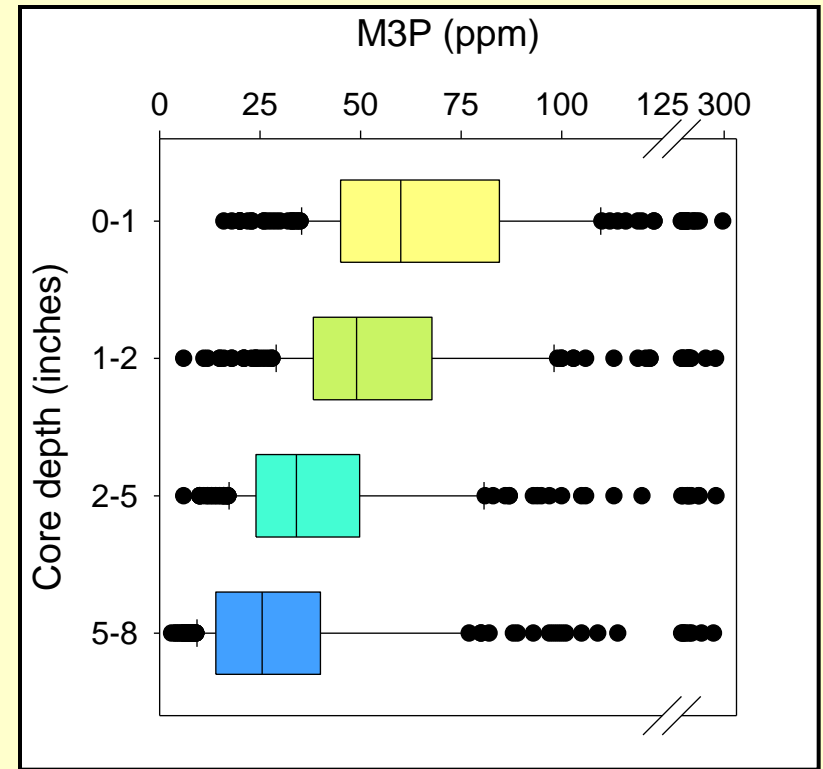

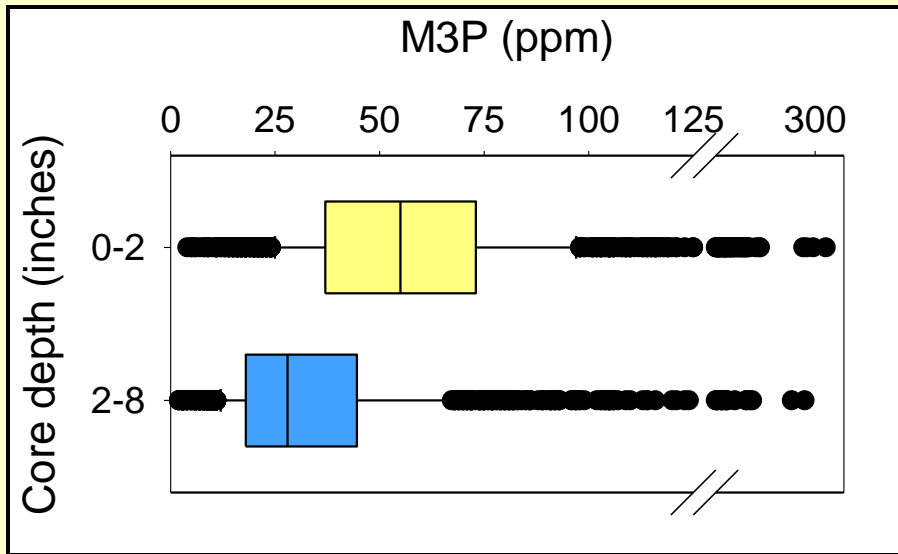

Environmental soil testing #2:
Composites of 0-1, 1-2, 2-5
and 5-8 inch portions of cores.

Results, Sandusky Stratified Soil Testing, 1,617 fields

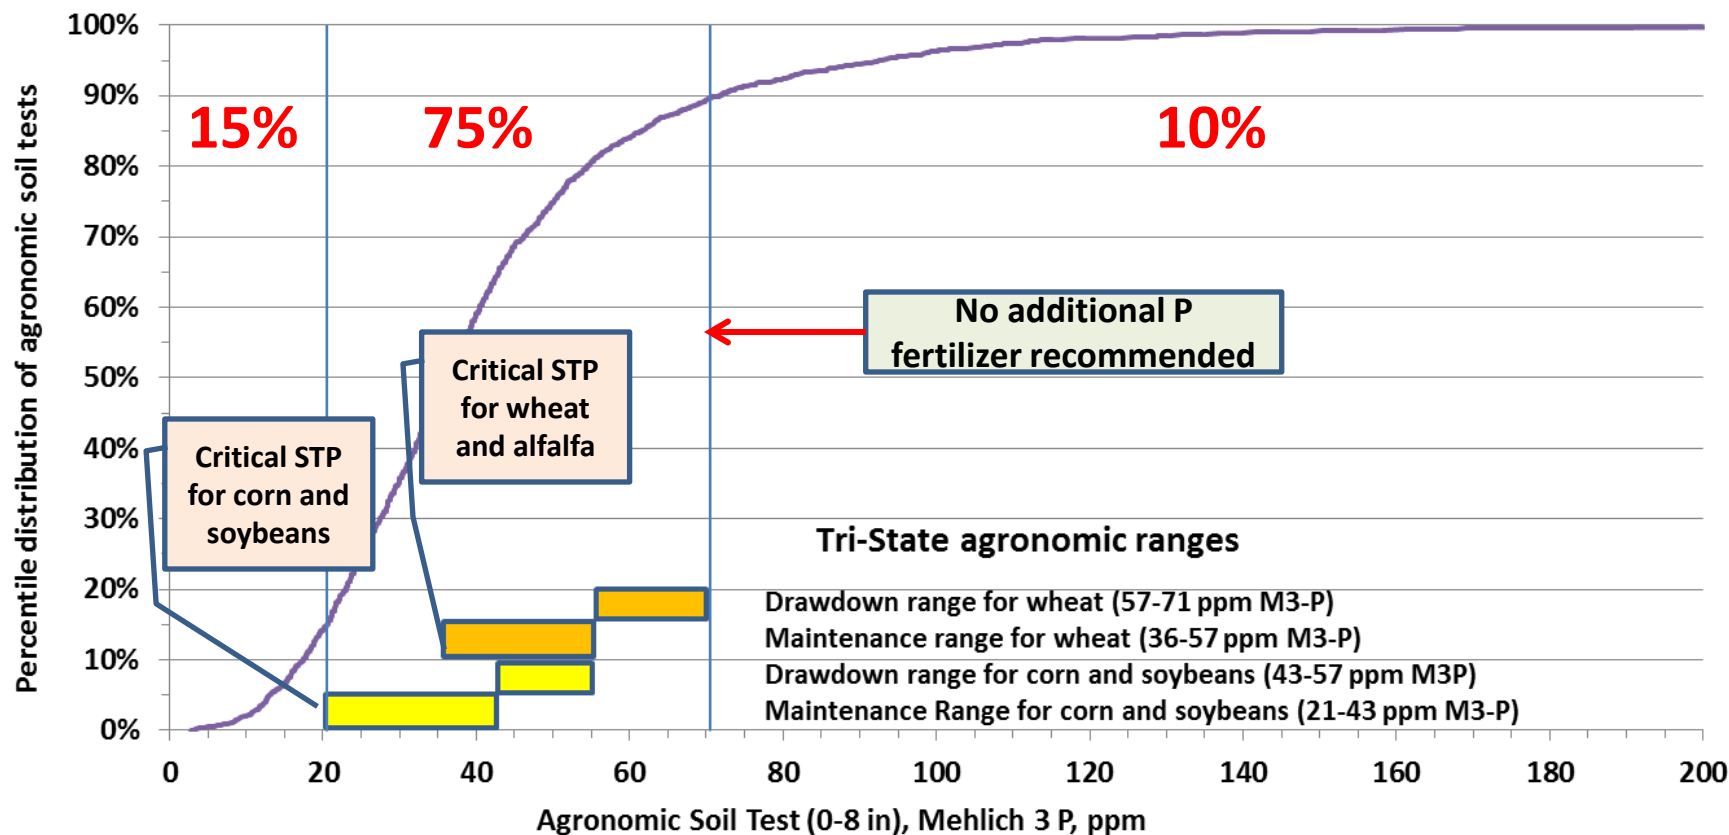

The extent of P stratification

Tri-State Fertilizer Recommendations

Percentile distribution of soil tests

How do soil test values in Ohio compare with these ranges?

Compared to most areas, Ohio's soil test levels are not excessive!

Phosphorus control programs: Phase 3 –

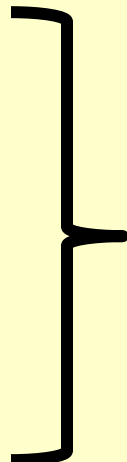

... reducing the concentrations of dissolved phosphorus in agricultural runoff.

Where are we in the Phase 3 process?

- **Planning phase**
- **Early implementation**

Likely components of Phase 3

- **Nutrient management – the 4-Rs**
- **Water management**
- **No-till/reduced till management**
- **Cover crops**
- **Conservation cropping systems**
- **Comprehensive soil health**
- **Targeting**
- **Off-field treatment (wetlands, etc.)**

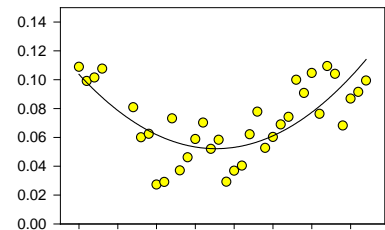

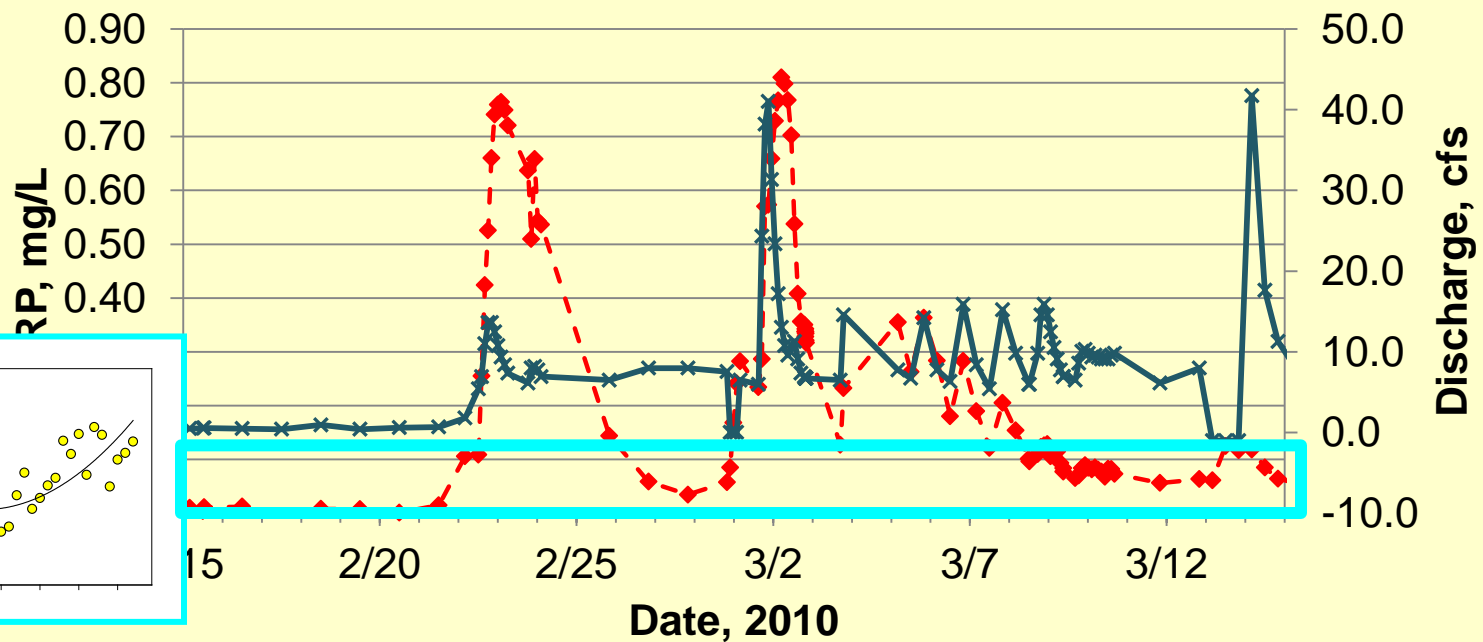

**Shifts in
multiple
components
of crop
production
systems ...
no silver
bullet.**

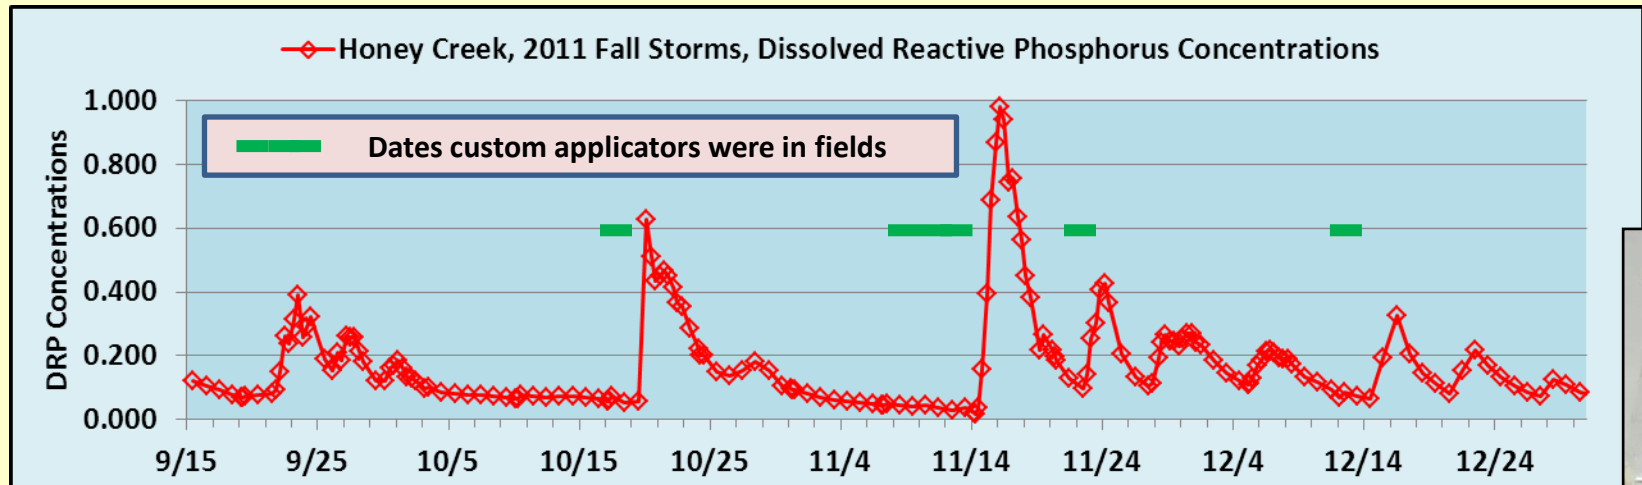

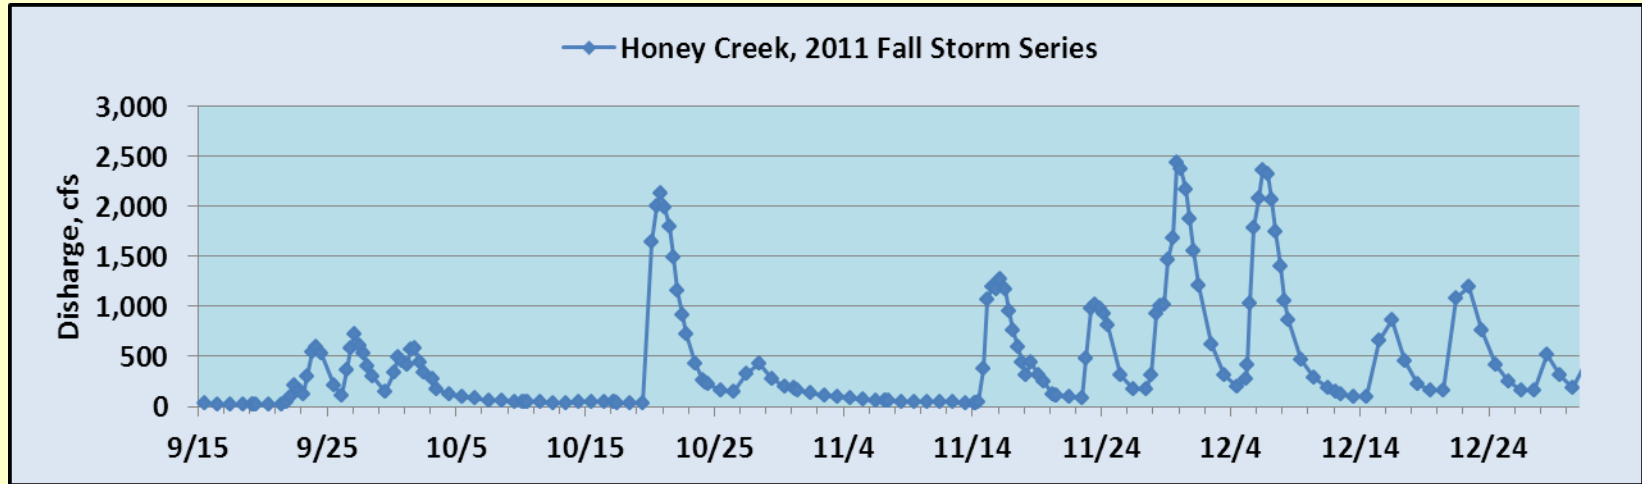

Fertilizer application on frozen ground

Lost Creek Snow Melt Runoff Events

Fertilizer application just before precipitation

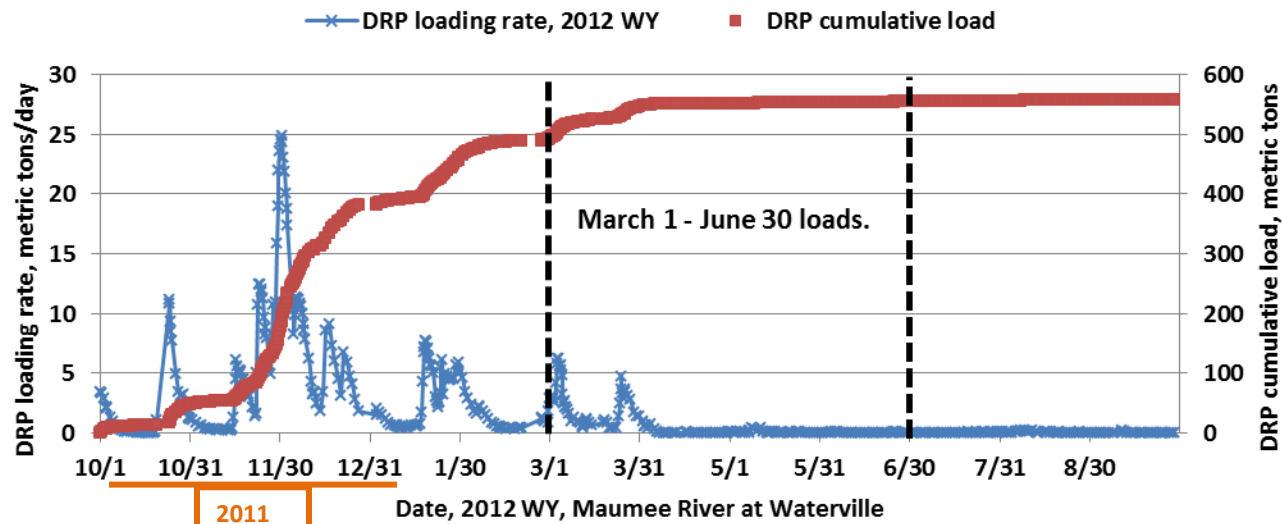

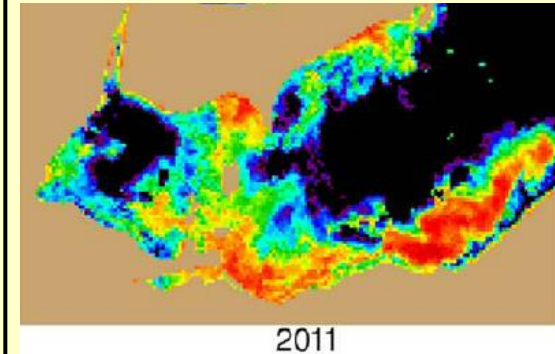

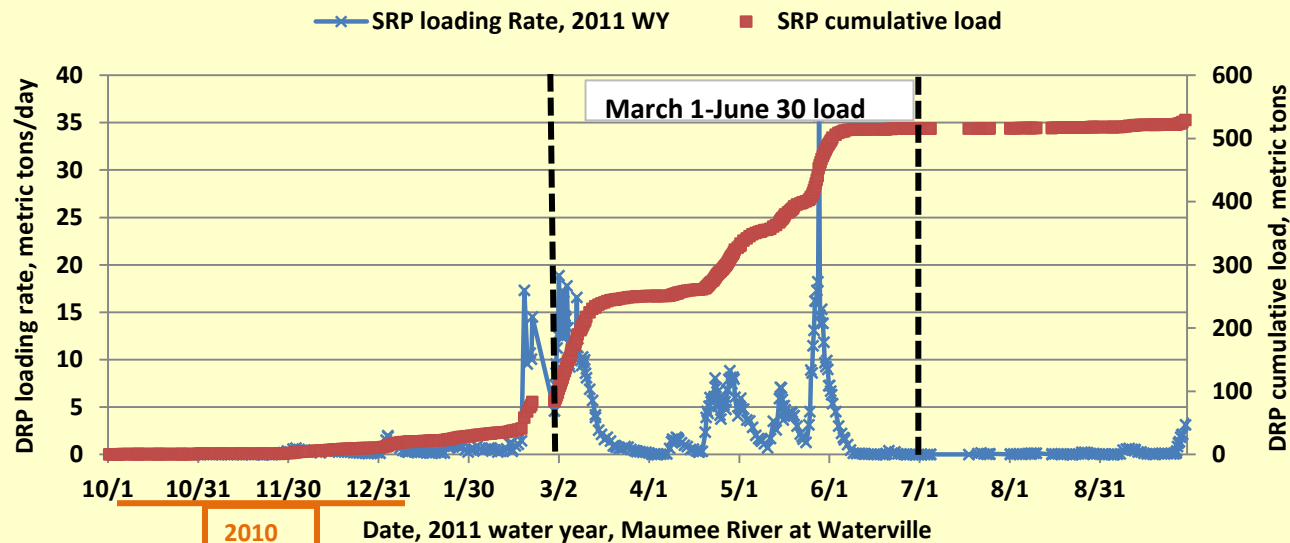

Fertilizer application rates versus watershed export rates --

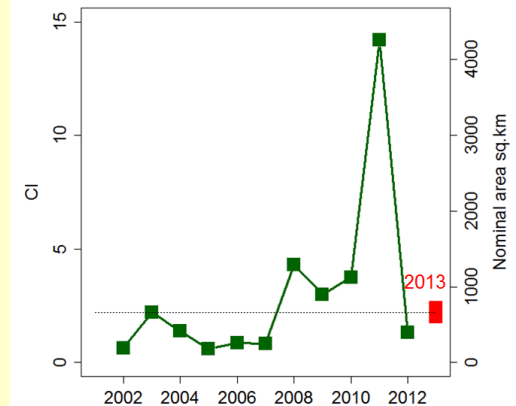

Watershed	TP export rate for whole watershed lbs/acre/year	DRP export rate for whole watershed lbs/acre/year	Agricultural land as fraction of watershed area	Non-ag-land as fraction of watershed area	TP export rate from cropland ¹	DRP export Rate from cropland ¹	TP runoff as % of maintenance ²	DRP runoff as % maintenance ²
Sandusky	1.53	0.35	0.776	0.224	1.72	0.392	8.3%	1.9%
Honey Cr.	1.47	0.44	0.811	0.189	1.62	0.488	7.8%	2.3%
Rock Cr.	1.63	0.29	0.719	0.281	1.89	0.334	9.1%	1.6%
Maumee	1.24	0.29	0.733	0.267	1.44	0.333	6.9%	1.6%
1. Assumes that the loss rate from non-cropland is 50% of that from cropland.								
2. Maintenance rate from NRCS Rapid Assessment of Sandusky Watershed (47.5 lbs P ₂ O ₅ per acre, 20.8 lbs P per acre)								

**Can we reduce a current loss rate
of <2% by 40-80%?
... no small task.**

Maumee River, DRP loading rate and cumulative loads, 2011 and 2012 WY

Bloom severity for western Lake Erie from satellite
(CI of $1 \sim 10^{20}$ cells)
