Genesis of This Project

- Prokopy et al. 2008, Baumgart-Getz et al. 2012:
 - Reviewed 55 studies from 1982-2007 in the U.S.
- Findings:
 - No consistent determinants of conservation adoption
 - Most often positively associated with conservation adoption: education, capital, income, farm size, access to information, positive environmental attitudes, environmental awareness, and social networks
- Since publication:
 - Increasing numbers of qualitative papers
 - Overall explosion of research in this area

Overview

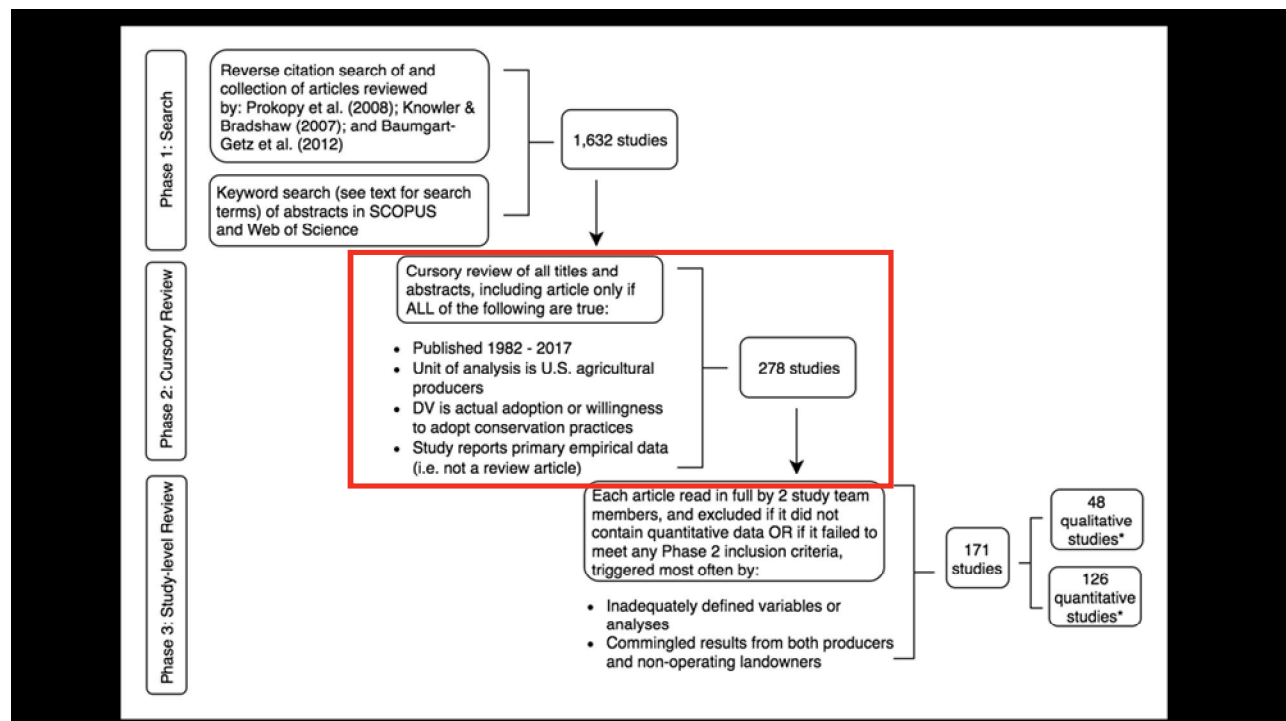

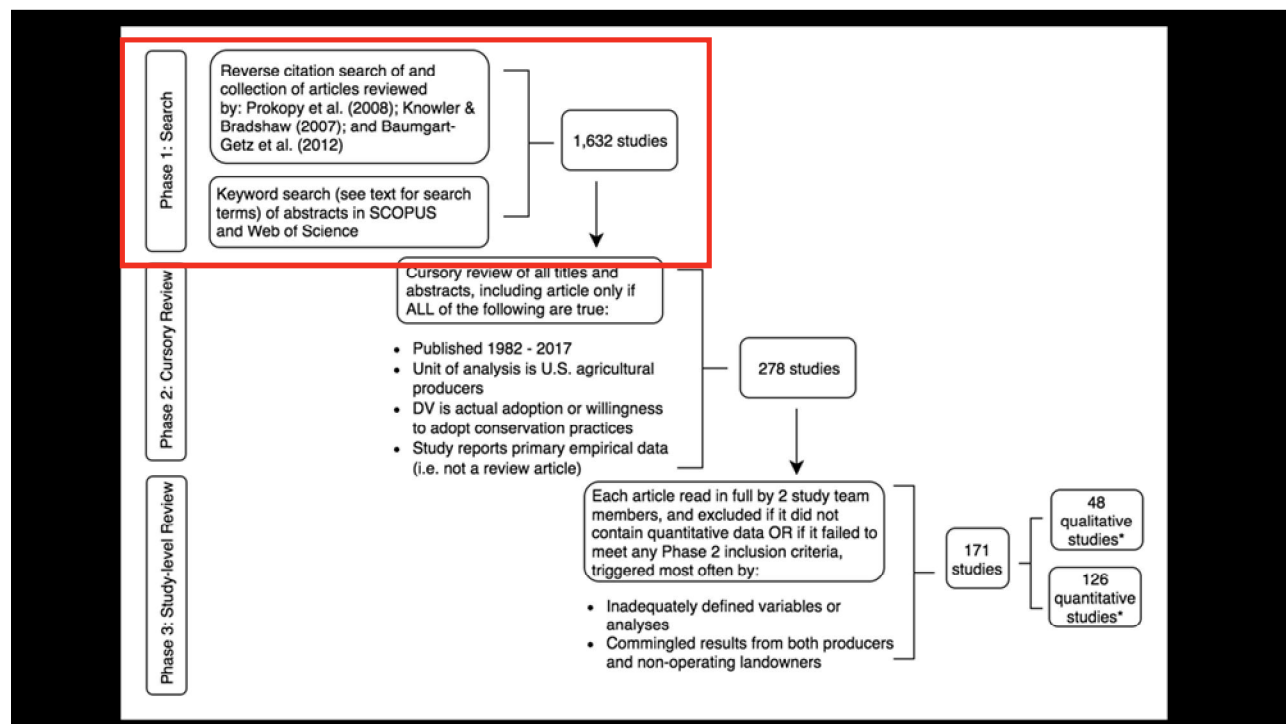

- Generating data
- Coding studies
- Selective results
- What this means for practice
- What this means for research
- Your questions and comments

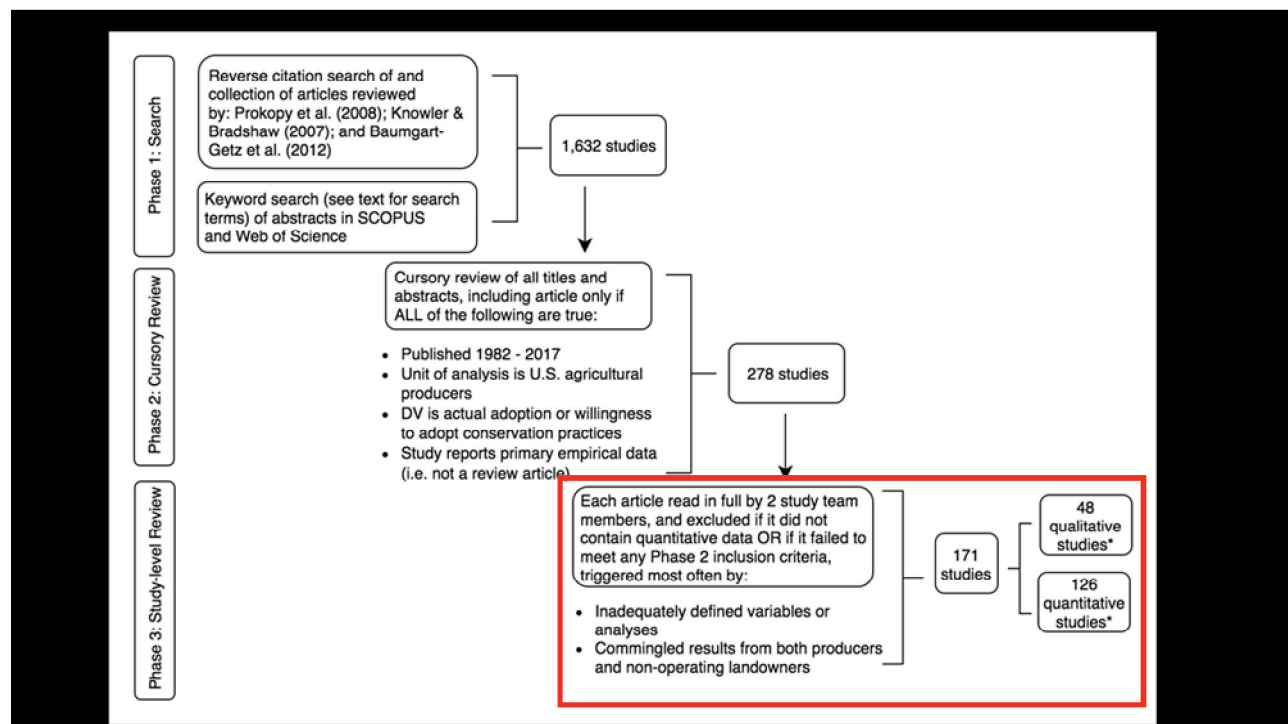

Generating Rows of Data: Finding Papers

Overview

- Inclusion/exclusion criteria
- Total: 171 studies; 126 quantitative, 48 qualitative
- For quantitative:
 - 2 reviewers on every paper
 - Collected all study level and individual analysis data
 - Recorded variables in authors' words

Coding Papers, aka where did the last 2 years of our lives go??

Coding Methods

- Primary and secondary coder for each paper
- Coding – excel template with dropdowns
- Study-level and individual level study sheets
- Each study on its own sheet for easy tracking
- Primary coded, then sent code sheet to secondary
 - Secondary reviewed coding, agreed or disagreed with primary
 - All disagreements discussed between primary and secondary until resolved
 - Remaining issues brought to full group

Image credit: by Stephen Kirkpatrick, organic crops in high tunnel. Courtesy of USDA NRCS.

Study Level Characteristics

- Key characteristics of each study (39 data fields)
- Theoretical grounding, data collection method, sampling method, response rate, population description, geographic scope, types of crops/livestock...
- 107 quantitative studies looking at adoption (excluding willingness)

Image credit: by Lance Cheung, taken at Sunny Ridge Farm, MD. Courtesy of USDA NRCS.

Dependent variables	Target population	Exclusion criteria
<ul style="list-style-type: none"> • Adoption/behaviors • Willingness to adopt • Willingness to accept payments • Interest in participating in practices, programs 	<ul style="list-style-type: none"> • Agricultural producers: • Conventional • Specialty • Organic • Agroforestry • Livestock • Row crops • Urban 	<ul style="list-style-type: none"> • Reviews, discussions • Sample selectivity models • >1 paper reporting on same model

Individual Study Results Coding

- Some papers had multiple analyses
- DV, DV measure type and IV/IV measure type
- For all DVs and IVs
 - Binary, categorical, ordinal, continuous *as described by authors*
 - Measure notes – scales used, meaning of coding (e.g. 0/1 =not adopt/adopt; 1-5 agreement from strongly disagree to strongly agree)
 - Analysis # and method
 - Vote count (pos, neg, insig)
 - p-value range, threshold used in paper, p-value
 - Model results (coefficients, t statistics, R2, etc.)

Coding Methods

- DV, IV category and subcategories NOT assigned during coding
- Full team meeting – 2 days in-person
- Weekly calls with majority

- **Attitudes**
- **Awareness**
- **Behavior**
- **Economic Factors**
- **Information**
- **Operator Characteristics**
- **Farm Characteristics**

Coding Qualitative Papers –
work led by Dr. Sarah Church
and Dr. Pranay Ranjan

Qualitative data: *What and why?*

- More and more qualitative studies since 2008
- Additional perspective
- Farmer voice
- Provides understanding and nuance

Coding Methods

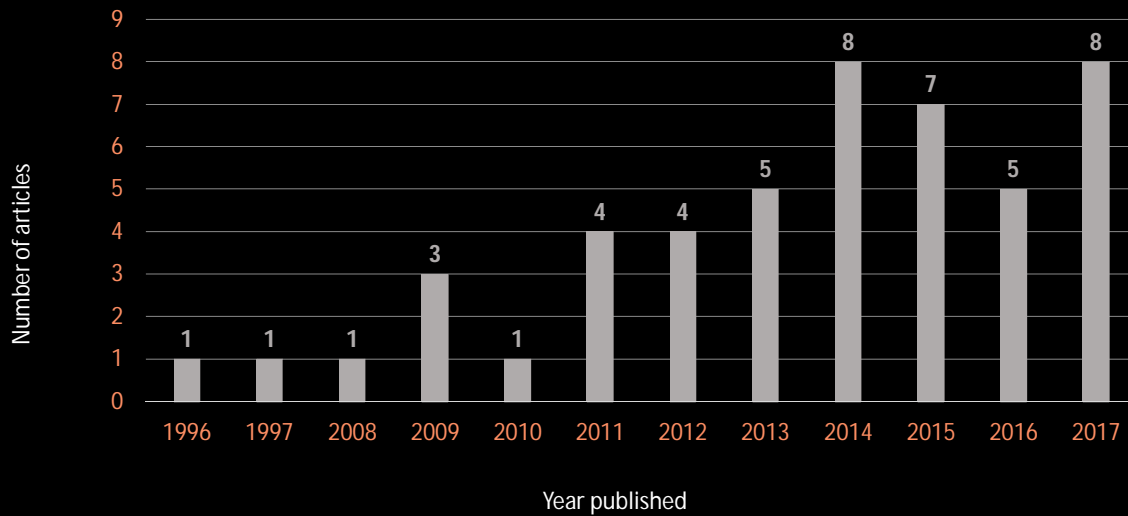

- Coding framework
 - Quantitative foundation
 - Refined inductively
- 48 articles
 - 2 researchers
 - 24 per researcher
- 2nd review on 24 articles
- Codebook refinement - definitions
- Reports to full group

Attitudes
(10 subcategories)

Barriers
(16 subcategories)

Motivations
(18 subcategories)

Results

Study Level Characteristics

Theoretical grounding

- Complete theoretical framework
- No theory employed
- Theory used in lit review
- Theory incorporated into discussion
- Other

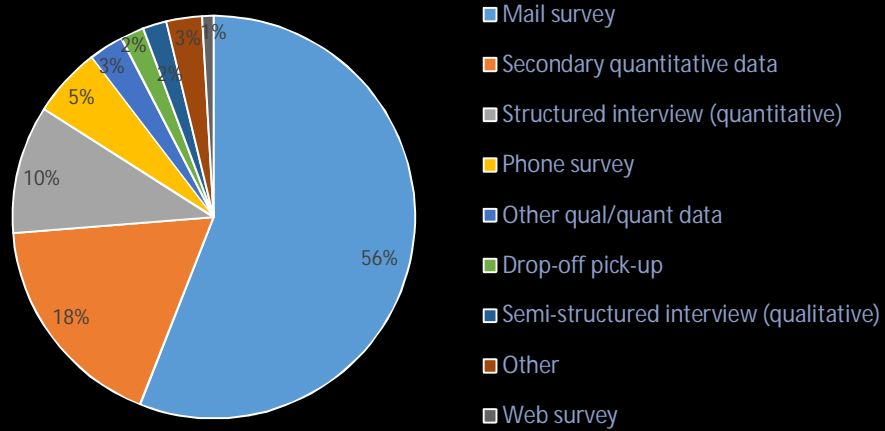

Specific theory

- Multiple
- Microeconomic theory
- Other
- Diffusion/innovation
- Theory of Planned Behavior

Study Level Characteristics

Data collection method

Study Level Characteristics

Sampling method

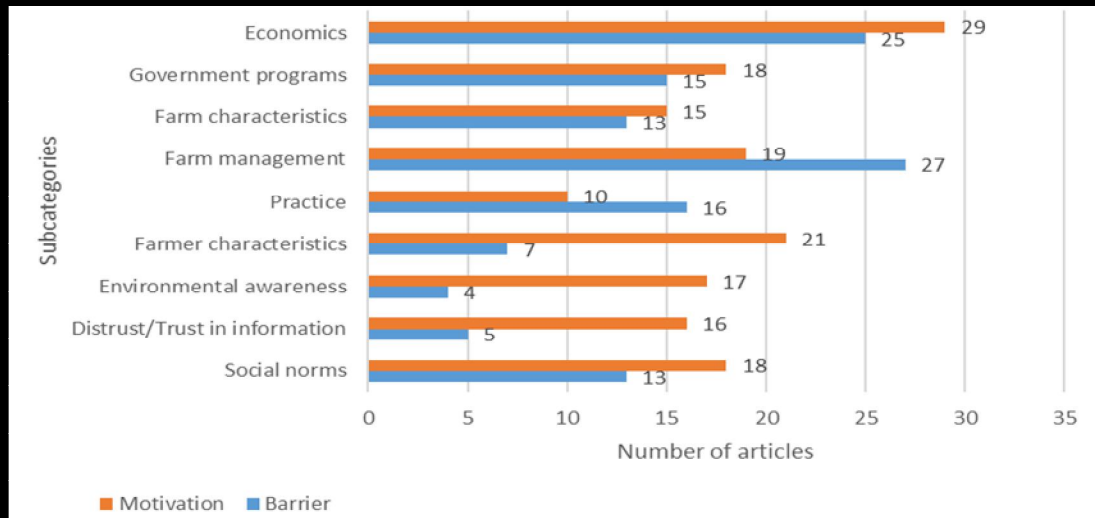

Results

Overall Quantitative Vote Count: Statistical Significance of IVs
All Models, 5757 rows of data, 78 Studies, 1982-2017

Prokopy et al., In Review, *Journal of Soil and Water Conservation*

Qualitative Results: *Motivations and barriers, overview* 48 papers, 1996-2017

Ranjan, Church, et al., In Review, *Society and Natural Resources*

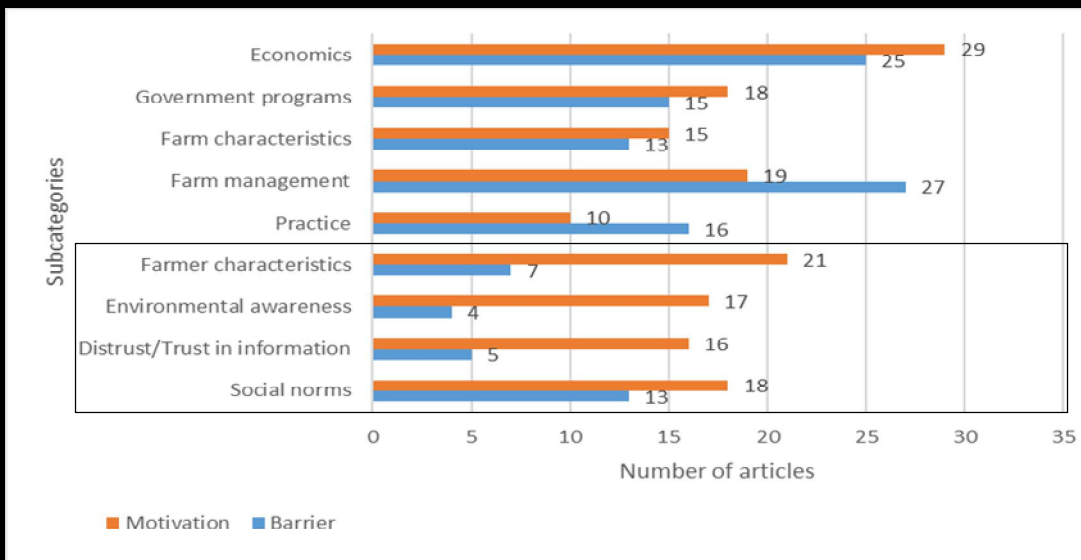

Results: *Motivations and barriers, overview*

Results: *Motivations and barriers, overview*

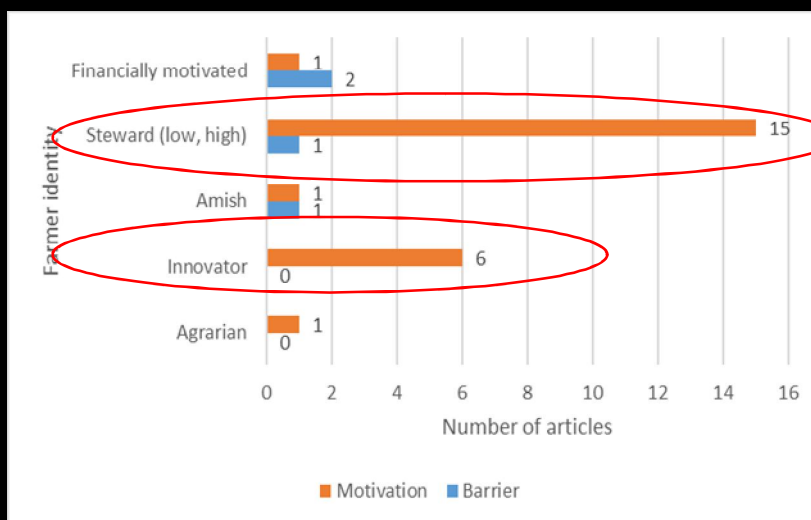

Results: *Motivations and barriers, overview*

Non-Financially Motivated Identity

Results: *Farmer identity*

"I wanna see the land preserved as much as possible. So we don't farm it to death or farm it in a way that it washes away or whatever."
(Druschke, 2013)

Positive Attitudes towards Practice

Results: *Economics child-categories*

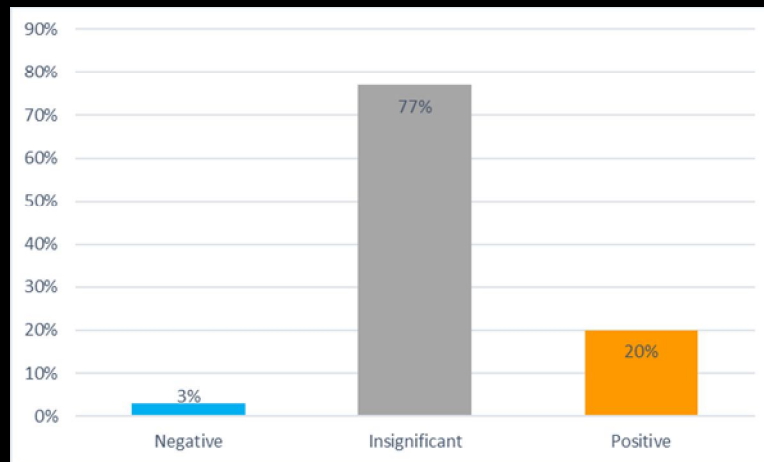

Results: *Economics child-categories*

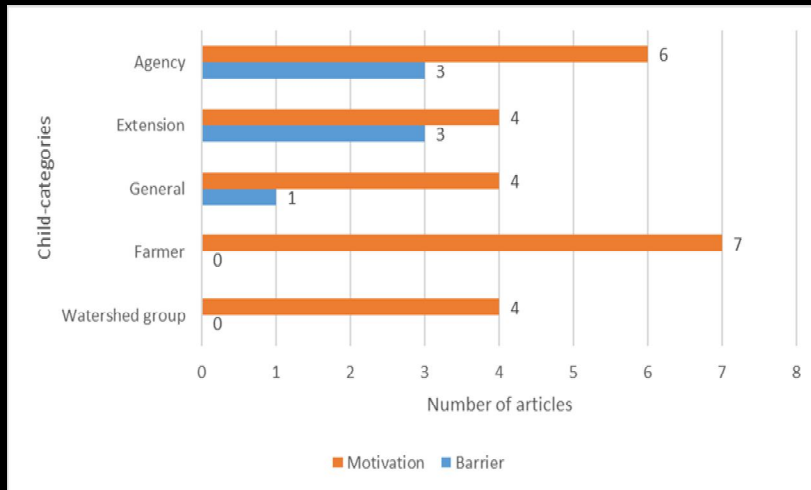

"Cost. I'm doing the numbers for cover crops right now and it's a lot of money for establishment."
(Krajewski, 2017)

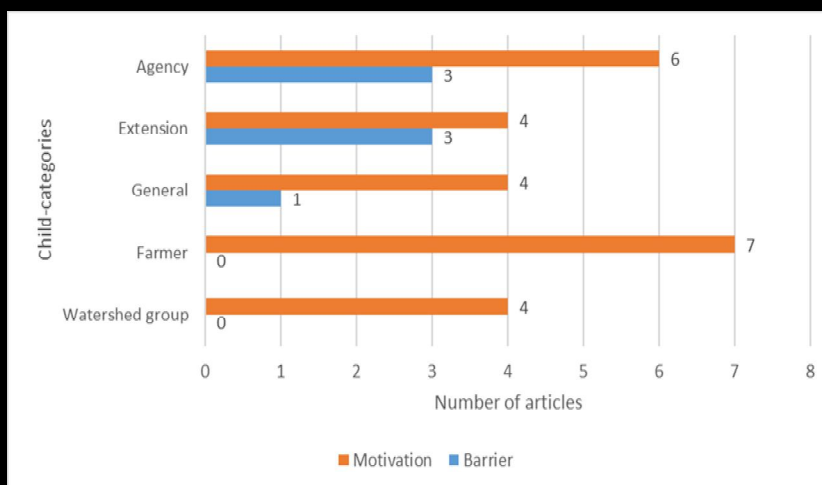

Seeking/Using Information

Results: *Trust/distrust in information child-categories*

Results: *Trust/distrust in information child-categories*

"Six farmers who had positive experiences with conservation programs mentioned the helpful nature of conservation personnel."
(Atwell et al., 2009)

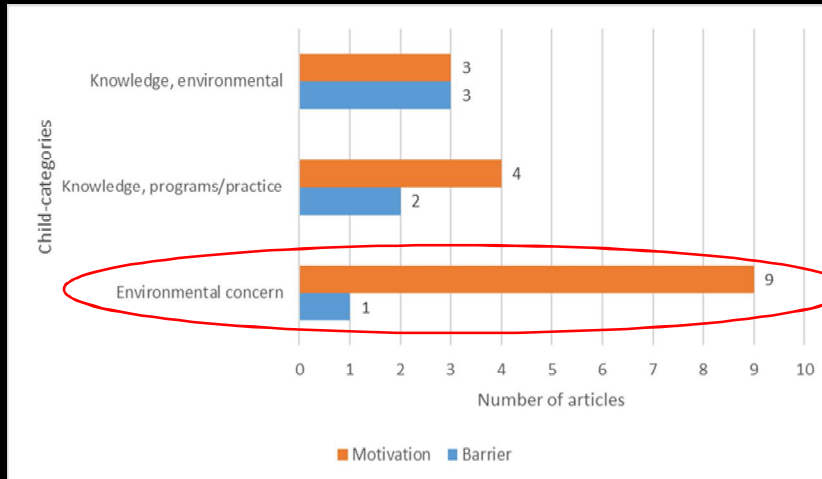

Awareness of Program/Practice

Results: *Environmental awareness child-categories*

Results: *Environmental awareness child-categories*

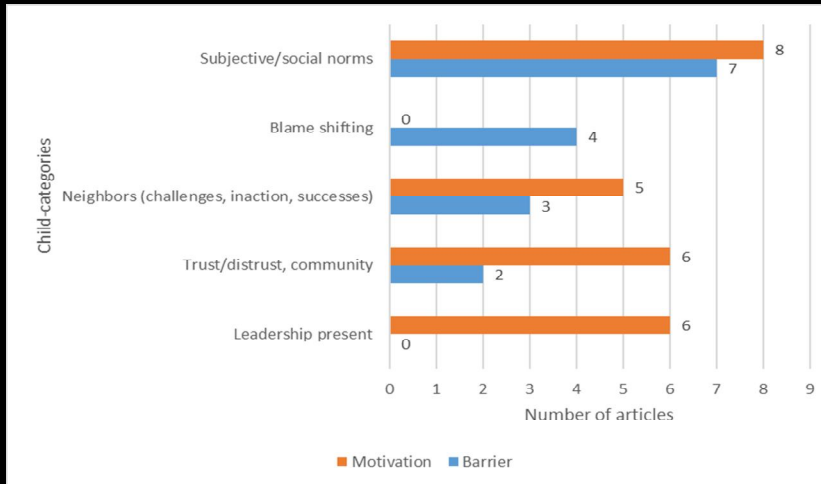

"If there was a practice that showed a great economic return, but yet resulted in, losing nitrogen, or losing nutrients or, you know, something that was really bad for water quality, I would think twice about it." (David et al., 2015)

Results: *Social norms child-categories*

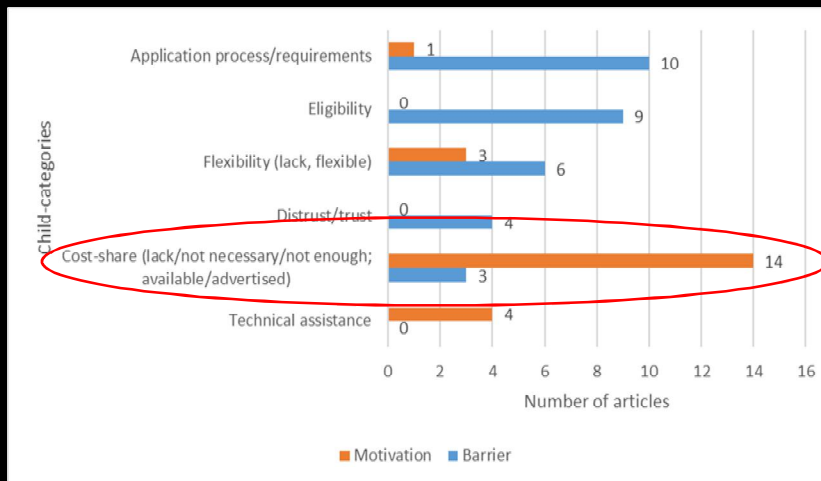

Results: *Social norms child-categories*

"Producers in this watershed discussed grassed waterways as if they were common sense and they needed them to control erosion, reflecting a commonly held belief as well as a perceived norm."

(Reimer et al., 2012)

Results: *Government programs child-categories*

"Agency staff and farmers alike noted the importance of cost-share programs and the agency's ability to advertise as critical in farmer decisions to adopt BMPs."

(Campbell et al. 2011)

Results: *Farm management child-categories*

Select Findings - Summary

- IMPORTANT =
 - Positive attitudes towards programs and practices
 - Awareness of programs/practices
 - Seeking and using information
 - Identity not driven solely by financial motives
 - Trust and social norms
 - Government programs – cost share
 - Systems thinking

Tenure: Ownership vs. Renting

Lessons Learned

Lessons Learned—Implications for Diffusion

- Information seeking/networking:
 - seeking and using information is critical!!!!
 - more info needed about role of training
 - more info about trust, change agents needed
 - better funding for Extension, more use of non-traditional actors?
- Positive attitudes toward programs and practices:
 - inadequacy of “information deficit” approach re: water quality problems and conservation adoption
 - economics of practice
- Stewardship identity:
 - more strategic/targeted message-framing
- Wherefore land tenure?
 - larger operators adopting a practice on all acres, no matter what
 - oversimplified measurement

Lessons Learned—For Technology Transfer

- No consistently strong predictors
- Many generally “not significant”
- Most predictor variable “positive” predictors. What about barriers?

Lessons Learned—Future Adoption Research

- Survey space and time are limited, can't ask about or measure all potential factors
- Many adoption studies have major weaknesses
 - lack of theoretical foundations, theory building
 - need for clarity in research design, data collection, and analysis
 - non-scientific sampling
 - lack of measurement consistency across studies, not validated
 - measurement error
- Bottom line: Quantitative adoption studies are not as helpful as we would like
 - Need for collaborative effort to address weaknesses, build consistency to compare results

Future Analyses

- Does the dependent variable (the actual practice or program) matter?
- Effect size analysis
- Willingness vs. adoption
- Drilling down into the independent variables
- Have explanatory variables changed over time?
